The purchase information of the Dedicated Host reservation and the Dedicated Hosts associated with it.

Type: Array of Purchase objects

**requestId**

The ID of the request.

Type: String

**totalHourlyPrice**

The potential total hourly price of the reservation per hour.

Type: String

**totalUpfrontPrice**

The potential total upfront price. This is billed immediately.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example is a preview of the reservation to be purchased.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=GetHostReservationPurchasePreview
&OfferingId=hro-0eb3541dght849c2d
&HostIdSet=h-0fgr9ddb0ecd0a1cd
&AUTHPARAMS
```

### Sample Response

```
<GetHostReservationPurchasePreviewResult xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>d4904fd9-84c3-4967-gtyk-a9983EXAMPLE</requestId>
        <purchase>
            <item>
                <duration>31536000</duration>
                <upfrontPrice>7453.000</upfrontPrice>
                <paymentOption>PartialUpfront</paymentOption>
                <instanceFamily>m4</instanceFamily>
                <hourlyPrice>0.850</hourlyPrice>
                <hostIdSet>
                    <item>h-0fgr9ddb0ecd0a1cd</item>
                </hostIdSet>
            </item>
       </purchase>
       <totalHourlyPrice>0.850<totalHourlyPrice>
       <totalUpfrontPrice>7453.000<totalUpfrontPrice>
</GetHostReservationPurchasePreviewResult>
```

# GetImageAncestry

Retrieves the ancestry chain of the specified AMI, tracing its lineage back to the root AMI. For more information, see AMI ancestry in *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ImageId**

The ID of the AMI whose ancestry you want to trace.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**imageAncestryEntrySet**

A list of entries in the AMI ancestry chain, from the specified AMI to the root AMI.

Type: Array of ImageAncestryEntry objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetImageBlockPublicAccessState

Gets the current state of *block public access for AMIs* at the account level in the specified AWS Region.

For more information, see Block public access to your AMIs in the *Amazon EC2 User Guide*.

## Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**imageBlockPublicAccessState**

The current state of block public access for AMIs at the account level in the specified AWS Region.

Possible values:

- `block-new-sharing` - Any attempt to publicly share your AMIs in the specified Region is blocked.
- `unblocked` - Your AMIs in the specified Region can be publicly shared.

Type: String

**managedBy**

The entity that manages the state for block public access for AMIs. Possible values include:

- `account` - The state is managed by the account.
- `declarative-policy` - The state is managed by a declarative policy and can't be modified by the account.

Type: String

Valid Values: `account | declarative-policy`

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example gets the state of *block public access for AMIs* at the account level in the specified Region to see whether the public sharing of your AMIs is blocked in your account. The value for the response is either `block-new-sharing` or `unblocked`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=GetImageBlockPublicAccessState
&Region=us-east-1
&AUTHPARAMS
```

#### Sample Response

```
<GetImageBlockPublicAccessStateResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>11aabb229-4eac-35bd-99ed-be587EXAMPLE</requestId>
  <return>block-new-sharing</return>
</GetImageBlockPublicAccessStateResponse>
```

# GetInstanceMetadataDefaults

Gets the default instance metadata service (IMDS) settings that are set at the account level in the specified AWS
Region.

For more information, see Order of precedence for instance metadata options in the *Amazon EC2 User Guide*.

## Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**accountLevel**

The account-level default IMDS settings.

Type: InstanceMetadataDefaultsResponse object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# GetInstanceTpmEkPub

Gets the public endorsement key associated with the Nitro Trusted Platform Module (NitroTPM) for the specified instance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Specify this parameter to verify whether the request will succeed, without actually making the request. If the request will succeed, the response is `DryRunOperation`. Otherwise, the response is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance for which to get the public endorsement key.

Type: String

Required: Yes

**KeyFormat**

The required public endorsement key format. Specify `der` for a DER-encoded public key that is compatible with OpenSSL. Specify `tpmt` for a TPM 2.0 format that is compatible with tpm2-tools. The returned key is base64 encoded.

Type: String

Valid Values: `der | tpmt`

Required: Yes

**KeyType**

The required public endorsement key type.

Type: String

Valid Values: `rsa-2048 | ecc-sec-p384`

Required: Yes

## Response Elements

The following elements are returned by the service.

**instanceId**

The ID of the instance.

Type: String

**keyFormat**

The public endorsement key format.

Type: String

Valid Values: `der | tpmt`

**keyType**

The public endorsement key type.

Type: String

Valid Values: `rsa-2048 | ecc-sec-p384`

**keyValue**

The public endorsement key material.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetInstanceTypesFromInstanceRequirements

Returns a list of instance types with the specified instance attributes. You can use the response to preview the instance types without launching instances. Note that the response does not consider capacity.

When you specify multiple parameters, you get instance types that satisfy all of the specified parameters. If you specify multiple values for a parameter, you get instance types that satisfy any of the specified values.

For more information, see Preview instance types with specified attributes, Specify attributes for instance type selection for EC2 Fleet or Spot Fleet, and Spot placement score in the *Amazon EC2 User Guide*, and Creating mixed instance groups using attribute-based instance type selection in the *Amazon EC2 Auto Scaling User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ArchitectureType.N**

The processor architecture type.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 3 items.

Valid Values: `i386 | x86_64 | arm64 | x86_64_mac | arm64_mac`

Required: Yes

**Context**

Reserved.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceRequirements**

The attributes required for the instance types.

Type: InstanceRequirementsRequest object

Required: Yes

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Required: No

**NextToken**

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

**VirtualizationType.N**

The virtualization type.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 2 items.

Valid Values: `hvm | paravirtual`

Required: Yes

## Response Elements

The following elements are returned by the service.

**instanceTypeSet**

The instance types with the specified instance attributes.

Type: Array of InstanceTypeInfoFromInstanceRequirements objects

**nextToken**

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetInstanceUefiData

A binary representation of the UEFI variable store. Only non-volatile variables are stored. This is a base64 encoded and zlib compressed binary value that must be properly encoded.

When you use register-image to create an AMI, you can create an exact copy of your variable store by passing the UEFI data in the `UefiData` parameter. You can modify the UEFI data by using the python-uefivars tool on GitHub. You can use the tool to convert the UEFI data into a human-readable format (JSON), which you can inspect and modify, and then convert back into the binary format to use with register-image.

For more information, see UEFI Secure Boot in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance from which to retrieve the UEFI data.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**instanceId**

The ID of the instance from which to retrieve the UEFI data.

Type: String

**requestId**

The ID of the request.

Type: String

**uefiData**

Base64 representation of the non-volatile UEFI variable store.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetIpamAddressHistory

Retrieve historical information about a CIDR within an IPAM scope. For more information, see View the history of IP addresses in the *Amazon VPC IPAM User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Cidr**

The CIDR you want the history of. The CIDR can be an IPv4 or IPv6 IP address range. If you enter a /16 IPv4 CIDR, you will get records that match it exactly. You will not get records for any subnets within the /16 CIDR.

Type: String

Required: Yes

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EndTime**

The end of the time period for which you are looking for history. If you omit this option, it will default to the current time.

Type: Timestamp

Required: No

**IpamScopeId**

The ID of the IPAM scope that the CIDR is in.

Type: String

Required: Yes

**MaxResults**

The maximum number of historical results you would like returned per page. Defaults to 100.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**StartTime**

The start of the time period for which you are looking for history. If you omit this option, it will default to the value of EndTime.

Type: Timestamp

Required: No

**VpcId**

The ID of the VPC you want your history records filtered by.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**historyRecordSet**

A historical record for a CIDR within an IPAM scope. If the CIDR is associated with an EC2 instance, you will see an object in the response for the instance and one for the network interface.

Type: Array of IpamAddressHistoryRecord objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetIpamDiscoveredAccounts

Gets IPAM discovered accounts. A discovered account is an AWS account that is monitored under a resource discovery. If you have integrated IPAM with AWS Organizations, all accounts in the organization are discovered accounts. Only the IPAM account can get all discovered accounts in the organization.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DiscoveryRegion**

The AWS Region that the account information is returned from.

Type: String

Required: Yes

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

Discovered account filters.

Type: Array of Filter objects

Required: No

**IpamResourceDiscoveryId**

A resource discovery ID.

Type: String

Required: Yes

**MaxResults**

The maximum number of discovered accounts to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**ipamDiscoveredAccountSet**

Discovered accounts.

Type: Array of IpamDiscoveredAccount objects

**nextToken**

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# GetIpamDiscoveredPublicAddresses

Gets the public IP addresses that have been discovered by IPAM.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddressRegion**

The AWS Region for the IP address.

Type: String

Required: Yes

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

Filters.

Type: Array of Filter objects

Required: No

**IpamResourceDiscoveryId**

An IPAM resource discovery ID.

Type: String

Required: Yes

**MaxResults**

The maximum number of IPAM discovered public addresses to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**ipamDiscoveredPublicAddressSet**

IPAM discovered public addresses.

Type: Array of IpamDiscoveredPublicAddress objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**oldestSampleTime**

The oldest successful resource discovery time.

Type: Timestamp

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# GetIpamDiscoveredResourceCidrs

Returns the resource CIDRs that are monitored as part of a resource discovery. A discovered resource is a resource CIDR monitored under a resource discovery. The following resources can be discovered: VPCs, Public IPv4 pools, VPC subnets, and Elastic IP addresses.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

Filters.

Type: Array of Filter objects

Required: No

**IpamResourceDiscoveryId**

A resource discovery ID.

Type: String

Required: Yes

**MaxResults**

The maximum number of discovered resource CIDRs to return in one page of results.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

Required: No

**ResourceRegion**

A resource Region.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**ipamDiscoveredResourceCidrSet**

Discovered resource CIDRs.

Type: Array of IpamDiscoveredResourceCidr objects

**nextToken**

Specify the pagination token from a previous request to retrieve the next page of results.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetIpamPolicyAllocationRules

Gets the allocation rules for an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters for the allocation rules.

Type: Array of Filter objects

Required: No

**IpamPolicyId**

The ID of the IPAM policy for which to get allocation rules.

Type: String

Required: Yes

**Locale**

The locale for which to get the allocation rules.

Type: String

Required: No

**MaxResults**

The maximum number of results to return in a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**ResourceType**

The resource type for which to get the allocation rules.

The AWS service or resource type that can use IP addresses through IPAM policies. Supported services and resource types include:

- Elastic IP addresses

Type: String

Valid Values: `alb | eip | rds | rnat`

Required: No

## Response Elements

The following elements are returned by the service.

**ipamPolicyDocumentSet**

The IPAM policy documents containing the allocation rules.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

Type: Array of IpamPolicyDocument objects

**nextToken**

The token to use to retrieve the next page of results.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetIpamPolicyOrganizationTargets

Gets the AWS Organizations targets for an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

A target can be an individual AWS account or an entity within an AWS Organization to which an IPAM policy can be applied.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters for the AWS Organizations targets.

Type: Array of Filter objects

Required: No

**IpamPolicyId**

The ID of the IPAM policy for which to get AWS Organizations targets.

Type: String

Required: Yes

**MaxResults**

The maximum number of results to return in a single call.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results.

Type: String

**organizationTargetSet**

The IDs of the AWS Organizations targets.

A target can be an individual AWS account or an entity within an AWS Organization to which an IPAM policy can be applied.

Type: Array of IpamPolicyOrganizationTarget objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# GetIpamPoolAllocations

Get a list of all the CIDR allocations in an IPAM pool. The Region you use should be the IPAM pool locale. The locale is the AWS Region where this IPAM pool is available for allocations.

> **Note**
>
> If you use this action after AllocateIpamPoolCidr or ReleaseIpamPoolAllocation, note that all EC2 API actions follow an eventual consistency model.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Type: Array of Filter objects

Required: No

**IpamPoolAllocationId**

The ID of the allocation.

Type: String

Required: No

**IpamPoolId**

The ID of the IPAM pool you want to see the allocations for.

Type: String

Required: Yes

**MaxResults**

The maximum number of results you would like returned per page.

Type: Integer

Valid Range: Minimum value of 1000. Maximum value of 100000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**ipamPoolAllocationSet**

The IPAM pool allocations you want information on.

Type: Array of IpamPoolAllocation objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetIpamPoolCidrs

Get the CIDRs provisioned to an IPAM pool.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Type: Array of Filter objects

Required: No

**IpamPoolId**

The ID of the IPAM pool you want the CIDR for.

Type: String

Required: Yes

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**ipamPoolCidrSet**

Information about the CIDRs provisioned to an IPAM pool.

Type: Array of IpamPoolCidr objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS Command Line Interface V2

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# GetIpamPrefixListResolverRules

Retrieves the CIDR selection rules for an IPAM prefix list resolver. Use this operation to view the business logic that determines which CIDRs are selected for synchronization with prefix lists.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters to limit the results.

Type: Array of Filter objects

Required: No

**IpamPrefixListResolverId**

The ID of the IPAM prefix list resolver whose rules you want to retrieve.

Type: String

Required: Yes

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**ruleSet**

The CIDR selection rules for the IPAM prefix list resolver.

Type: Array of IpamPrefixListResolverRule objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# GetIpamPrefixListResolverVersionEntries

Retrieves the CIDR entries for a specific version of an IPAM prefix list resolver. This shows the actual CIDRs that were selected and synchronized at a particular point in time.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPrefixListResolverId**

The ID of the IPAM prefix list resolver whose version entries you want to retrieve.

Type: String

Required: Yes

**IpamPrefixListResolverVersion**

The version number of the resolver for which to retrieve CIDR entries. If not specified, the latest version is used.

Type: Long

Required: Yes

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**entrySet**

The CIDR entries for the specified resolver version.

Type: Array of IpamPrefixListResolverVersionEntry objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# GetIpamPrefixListResolverVersions

Retrieves version information for an IPAM prefix list resolver.

Each version is a snapshot of what CIDRs matched your rules at that moment in time. The version number increments every time the CIDR list changes due to infrastructure changes.

**Version example:**

**Initial State (Version 1)**

Production environment:

- vpc-prod-web (10.1.0.0/16) - tagged env=prod
- vpc-prod-db (10.2.0.0/16) - tagged env=prod

Resolver rule: Include all VPCs tagged env=prod

**Version 1 CIDRs:** 10.1.0.0/16, 10.2.0.0/16

**Infrastructure Change (Version 2)**

New VPC added:

- vpc-prod-api (10.3.0.0/16) - tagged env=prod

IPAM automatically detects the change and creates a new version.

**Version 2 CIDRs:** 10.1.0.0/16, 10.2.0.0/16, 10.3.0.0/16

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters to limit the results.

Type: Array of Filter objects

Required: No

**IpamPrefixListResolverId**

The ID of the IPAM prefix list resolver whose versions you want to retrieve.

Type: String

Required: Yes

**IpamPrefixListResolverVersion.N**

Specific version numbers to retrieve. If not specified, all versions are returned.

Type: Array of longs

Required: No

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**ipamPrefixListResolverVersionSet**

Information about the IPAM prefix list resolver versions.

Type: Array of IpamPrefixListResolverVersion objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetIpamResourceCidrs

Returns resource CIDRs managed by IPAM in a given scope. If an IPAM is associated with more than one resource discovery, the resource CIDRs across all of the resource discoveries is returned. A resource discovery is an IPAM component that enables IPAM to manage and monitor resources that belong to the owning account.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters for the request. For more information about filtering, see Filtering CLI output.

Type: Array of Filter objects

Required: No

**IpamPoolId**

The ID of the IPAM pool that the resource is in.

Type: String

Required: No

**IpamScopeId**

The ID of the scope that the resource is in.

Type: String

Required: Yes

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**ResourceId**

The ID of the resource.

Type: String

Required: No

**ResourceOwner**

The ID of the AWS account that owns the resource.

Type: String

Required: No

**ResourceTag**

The resource tag.

Type: RequestIpamResourceTag object

Required: No

**ResourceType**

The resource type.

Type: String

Valid Values: `vpc | subnet | eip | public-ipv4-pool | ipv6-pool | eni | anycast-ip-list`

Required: No

## Response Elements

The following elements are returned by the service.

**ipamResourceCidrSet**

The resource CIDRs.

Type: Array of IpamResourceCidr objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# GetLaunchTemplateData

Retrieves the configuration data of the specified instance. You can use this data to create a launch template.

This action calls on other describe actions to get instance information. Depending on your instance configuration, you may need to allow the following actions in your IAM policy: `DescribeSpotInstanceRequests`, `DescribeInstanceCreditSpecifications`, `DescribeVolumes`, and `DescribeInstanceAttribute`. Or, you can allow `describe*` depending on your instance requirements.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**launchTemplateData**

The instance data.

Type: ResponseLaunchTemplateData object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example gets the data for instance `i-123456abcabc123ab`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=GetLaunchTemplateData
&InstanceId=i-123456abcabc123ab
&AUTHPARAMS
```

#### Sample Response

```
<GetLaunchTemplateDataResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>57372b95-c320-409e-b268-1e4example</requestId>
    <launchTemplateData>
        <blockDeviceMappingSet>
            <item>
                <deviceName>/dev/xvda</deviceName>
                <ebs>
                    <deleteOnTermination>true</deleteOnTermination>
                </ebs>
            </item>
        </blockDeviceMappingSet>
        <ebsOptimized>false</ebsOptimized>
        <iamInstanceProfile>
            <arn>arn:aws:iam::123456789012:instance-profile/AdminRole</arn>
        </iamInstanceProfile>
        <imageId>ami-1a2b3c4d</imageId>
        <instanceType>t2.micro</instanceType>
```

```
        <keyName>kp-us-east</keyName>
        <monitoring/>
        <networkInterfaceSet>
            <item>
                <description>Primary network interface</description>

# GetManagedPrefixListAssociations

Gets information about the resources that are associated with the specified managed prefix list.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 255.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**PrefixListId**

The ID of the prefix list.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**prefixListAssociationSet**

Information about the associations.

Type: Array of PrefixListAssociation objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example gets the associations for the specified managed prefix list.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=GetManagedPrefixListAssociations
&PrefixListId=pl-0123123123123aabb
&AUTHPARAMS
```

#### Sample Response

```
<GetManagedPrefixListAssociationsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
```

```
    <requestId>3ae1bcdf-4042-47f8-9b8a-example</requestId>
    <prefixListAssociationSet>
        <item>
            <resourceId>sg-01234567811abcaba</resourceId>
            <resourceOwner>123456789012</resourceOwner>
        </item>
    </prefixListAssociationSet>
</GetManagedPrefixListAssociationsResponse>
```

# GetManagedPrefixListEntries

Gets information about the entries for a specified managed prefix list.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 100.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**PrefixListId**

The ID of the prefix list.

Type: String

Required: Yes

**TargetVersion**

The version of the prefix list for which to return the entries. The default is the current version.

Type: Long

Required: No

## Response Elements

The following elements are returned by the service.

**entrySet**

Information about the prefix list entries.

Type: Array of PrefixListEntry objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example gets the entries for the specified managed prefix list.

### Sample Request

```
https://ec2.amazonaws.com/?Action=GetManagedPrefixListEntries
&PrefixListId=pl-0123123123123aabb
&AUTHPARAMS
```

### Sample Response

```
<GetManagedPrefixListEntriesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>39a3c79f-846f-4382-a592-example</requestId>
    <entrySet>
        <item>
            <cidr>10.0.0.0/16</cidr>
            <description>vpc-a</description>
        </item>
        <item>
            <cidr>10.2.0.0/16</cidr>
            <description>NY office</description>
        </item>
    </entrySet>
</GetManagedPrefixListEntriesResponse>
```

# GetManagedResourceVisibility

Retrieves the managed resource visibility configuration for the account. The response indicates whether managed resources are hidden or visible by default.

## Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**visibility**

The managed resource visibility settings for the account.

Type: ManagedResourceVisibilitySettings object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# GetNetworkInsightsAccessScopeAnalysisFindings

Gets the findings for the specified Network Access Scope analysis.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

**NetworkInsightsAccessScopeAnalysisId**

The ID of the Network Access Scope analysis.

Type: String

Required: Yes

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**analysisFindingSet**

The findings associated with Network Access Scope Analysis.

Type: Array of AccessScopeAnalysisFinding objects

**analysisStatus**

The status of Network Access Scope Analysis.

Type: String

Valid Values: `running | succeeded | failed`

**networkInsightsAccessScopeAnalysisId**

The ID of the Network Access Scope analysis.

Type: String

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# GetNetworkInsightsAccessScopeContent

Gets the content for the specified Network Access Scope.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**NetworkInsightsAccessScopeId**

The ID of the Network Access Scope.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**networkInsightsAccessScopeContent**

The Network Access Scope content.

Type: NetworkInsightsAccessScopeContent object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# GetPasswordData

Retrieves the encrypted administrator password for a running Windows instance.

The Windows password is generated at boot by the `EC2Config` service or `EC2Launch` scripts (Windows Server 2016 and later). This usually only happens the first time an instance is launched. For more information, see EC2Config and EC2Launch in the *Amazon EC2 User Guide*.

For the `EC2Config` service, the password is not generated for rebundled AMIs unless `Ec2SetPassword` is enabled before bundling.

The password is encrypted using the key pair that you specified when you launched the instance. You must provide the corresponding key pair file.

When you launch an instance, password generation and encryption may take a few minutes. If you try to retrieve the password before it's available, the output returns an empty string. We recommend that you wait up to 15 minutes after launching an instance before trying to retrieve the generated password.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the Windows instance.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**instanceId**

The ID of the Windows instance.

Type: String

**passwordData**

The password of the instance. Returns an empty string if the password is not available.

Type: String

**requestId**

The ID of the request.

Type: String

**timestamp**

The time the data was last updated.

Type: Timestamp

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example returns the encrypted version of the administrator password for the specified instance.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=GetPasswordData
&InstanceId=i-1234567890abcdef0
```

```
&AUTHPARAMS
```

### Sample Response

```
<GetPasswordDataResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instanceId>i-1234567890abcdef0</instanceId>
  <timestamp>2009-10-24 15:00:00</timestamp>

 <passwordData>TGludXggdmVyc2lvbiAyLjYuMTYteGVuVSAoYnVpbGRlckBwYXRjaGJhdC5hbWF6b25zYSkgKGdj</
passwordData>
</GetPasswordDataResponse>
```

# GetReservedInstancesExchangeQuote

Returns a quote and exchange information for exchanging one or more specified Convertible Reserved Instances for a new Convertible Reserved Instance. If the exchange cannot be performed, the reason is returned in the response. Use AcceptReservedInstancesExchangeQuote to perform the exchange.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ReservedInstanceId.N**

The IDs of the Convertible Reserved Instances to exchange.

Type: Array of strings

Required: Yes

**TargetConfiguration.N**

The configuration of the target Convertible Reserved Instance to exchange for your current Convertible Reserved Instances.

Type: Array of TargetConfigurationRequest objects

Required: No

## Response Elements

The following elements are returned by the service.

**currencyCode**

The currency of the transaction.

Type: String

**isValidExchange**

If `true`, the exchange is valid. If `false`, the exchange cannot be completed.

Type: Boolean

**outputReservedInstancesWillExpireAt**

The new end date of the reservation term.

Type: Timestamp

**paymentDue**

The total true upfront charge for the exchange.

Type: String

**requestId**

The ID of the request.

Type: String

**reservedInstanceValueRollup**

The cost associated with the Reserved Instance.

Type: ReservationValue object

**reservedInstanceValueSet**

The configuration of your Convertible Reserved Instances.

Type: Array of ReservedInstanceReservationValue objects

**targetConfigurationValueRollup**

The cost associated with the Reserved Instance.

Type: ReservationValue object

**targetConfigurationValueSet**

The values of the target Convertible Reserved Instances.

Type: Array of TargetReservationValue objects

**validationFailureReason**

Describes the reason why the exchange cannot be completed.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example describes the output of requesting whether a potential exchange is valid.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=GetReservedInstancesExchangeQuote
&ReservedInstanceId.1=649fd0c8-7768-46b8-8f84-a6400EXAMPLE
&TargetConfiguration.1.OfferingId=24167194-6541-4041-9e31-bc7c5984aa53
&AUTHPARAMS
```

#### Sample Response

```
<GetReservedInstancesExchangeQuoteResponse>
  <requestId>d072f652-cc57-458c-89e0-e6c02EXAMPLE</requestId>
  <outputReservedInstancesWillExpireAt>2019-05-17T12:32:53Z</
outputReservedInstancesWillExpireAt>
  <reservedInstanceValueSet>
    <item>
        <reservedInstancesId>649fd0c8-7768-46b8-8f84-a6400EXAMPLE</reservedInstanceId>
        <reservationValue>
            <remainingTotalValue>98.048402</remainingTotalValue>
```

```
            <hourlyPrice>0.018000</hourlyPrice>
            <remainingUpfrontValue>631.0</remainingUpfrontValue>
        </reservationValue>
    </item>
  </reservedInstanceValueSet>
  <targetConfigurationValueSet>
  <isValidExchange>false</isValidExchange>
  <paymentDue>-448.416438</paymentDue>
  <targetConfigurationValueRollup>
          <remainingTotalValue>0</remainingTotalValue>

# GetRouteServerAssociations

Gets information about the associations for the specified route server.

A route server association is the connection established between a route server and a VPC.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**RouteServerId**

The ID of the route server for which to get association information.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**routeServerAssociationSet**

Information about the associations for the specified route server.

Type: Array of RouteServerAssociation objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetRouteServerPropagations

Gets information about the route propagations for the specified route server.

When enabled, route server propagation installs the routes in the FIB on the route table you've specified. Route server supports IPv4 and IPv6 route propagation.

Amazon VPC Route Server simplifies routing for traffic between workloads that are deployed within a VPC and its internet gateways. With this feature, VPC Route Server dynamically updates VPC and internet gateway route tables with your preferred IPv4 or IPv6 routes to achieve routing fault tolerance for those workloads. This enables you to automatically reroute traffic within a VPC, which increases the manageability of VPC routing and interoperability with third-party workloads.

Route server supports the follow route table types:

- VPC route tables not associated with subnets
- Subnet route tables
- Internet gateway route tables

Route server does not support route tables associated with virtual private gateways. To propagate routes into a transit gateway route table, use Transit Gateway Connect.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**RouteServerId**

The ID of the route server for which to get propagation information.

Type: String

Required: Yes

**RouteTableId**

The ID of the route table for which to get propagation information.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**routeServerPropagationSet**

Information about the route propagations for the specified route server.

Type: Array of RouteServerPropagation objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetRouteServerRoutingDatabase

Gets the routing database for the specified route server. The Routing Information Base (RIB) serves as a database that stores all the routing information and network topology data collected by a router or routing system, such as routes learned from BGP peers. The RIB is constantly updated as new routing information is received or existing routes change. This ensures that the route server always has the most current view of the network topology and can make optimal routing decisions.

Amazon VPC Route Server simplifies routing for traffic between workloads that are deployed within a VPC and its internet gateways. With this feature, VPC Route Server dynamically updates VPC and internet gateway route tables with your preferred IPv4 or IPv6 routes to achieve routing fault tolerance for those workloads. This enables you to automatically reroute traffic within a VPC, which increases the manageability of VPC routing and interoperability with third-party workloads.

Route server supports the follow route table types:

- VPC route tables not associated with subnets
- Subnet route tables
- Internet gateway route tables

Route server does not support route tables associated with virtual private gateways. To propagate routes into a transit gateway route table, use Transit Gateway Connect.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

Filters to apply to the routing database query.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of routing database entries to return in a single response.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**RouteServerId**

The ID of the route server for which to get the routing database.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**areRoutesPersisted**

Indicates whether routes are being persisted in the routing database.

Type: Boolean

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**routeSet**

The collection of routes in the route server's routing database.

Type: Array of RouteServerRoute objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# GetSecurityGroupsForVpc

Gets security groups that can be associated by the AWS account making the request with network interfaces in the specified VPC.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

The filters. If using multiple filters, the results include security groups which match all filters.

- `group-id`: The security group ID.
- `description`: The security group's description.
- `group-name`: The security group name.
- `owner-id`: The security group owner ID.
- `primary-vpc-id`: The VPC ID in which the security group was created.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

**VpcId**

The VPC ID where the security group can be used.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

**requestId**

The ID of the request.

Type: String

**securityGroupForVpcSet**

The security group that can be used by interfaces in the VPC.

Type: Array of SecurityGroupForVpc objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# GetSerialConsoleAccessStatus

Retrieves the access status of your account to the EC2 serial console of all instances. By default, access to the EC2 serial console is disabled for your account. For more information, see Manage account access to the EC2 serial console in the *Amazon EC2 User Guide*.

## Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**managedBy**

The entity that manages access to the serial console. Possible values include:

- `account` - Access is managed by the account.
- `declarative-policy` - Access is managed by a declarative policy and can't be modified by the account.

Type: String

Valid Values: `account | declarative-policy`

**requestId**

The ID of the request.

Type: String

**serialConsoleAccessEnabled**

If `true`, access to the EC2 serial console of all instances is enabled for your account. If `false`, access to the EC2 serial console of all instances is disabled for your account.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# GetSnapshotBlockPublicAccessState

Gets the current state of *block public access for snapshots* setting for the account and Region.

For more information, see Block public access for snapshots in the *Amazon EBS User Guide*.

## Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**managedBy**

The entity that manages the state for block public access for snapshots. Possible values include:

- `account` - The state is managed by the account.
- `declarative-policy` - The state is managed by a declarative policy and can't be modified by the account.

Type: String

Valid Values: `account | declarative-policy`

**requestId**

The ID of the request.

Type: String

**state**

The current state of block public access for snapshots. Possible values include:

- `block-all-sharing` - All public sharing of snapshots is blocked. Users in the account can't request new public sharing. Additionally, snapshots that were already publicly shared are treated as private and are not publicly available.
- `block-new-sharing` - Only new public sharing of snapshots is blocked. Users in the account can't request new public sharing. However, snapshots that were already publicly shared, remain publicly available.
- `unblocked` - Public sharing is not blocked. Users can publicly share snapshots.

Type: String

Valid Values: `block-all-sharing | block-new-sharing | unblocked`

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Ruby V3

# GetSpotPlacementScores

Calculates the Spot placement score for a Region or Availability Zone based on the specified target capacity and compute requirements.

You can specify your compute requirements either by using `InstanceRequirementsWithMetadata` and letting Amazon EC2 choose the optimal instance types to fulfill your Spot request, or you can specify the instance types by using `InstanceTypes`.

For more information, see Spot placement score in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceRequirementsWithMetadata**

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with those attributes.

If you specify `InstanceRequirementsWithMetadata`, you can't specify `InstanceTypes`.

Type: InstanceRequirementsWithMetadataRequest object

Required: No

**InstanceType.N**

The instance types. We recommend that you specify at least three instance types. If you specify one or two instance types, or specify variations of a single instance type (for example, an `m3.xlarge` with and without instance storage), the returned placement score will always be low.

If you specify `InstanceTypes`, you can't specify `InstanceRequirementsWithMetadata`.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 1000 items.

Required: No

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 10. Maximum value of 1000.

Required: No

**NextToken**

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

**RegionName.N**

The Regions used to narrow down the list of Regions to be scored. Enter the Region code, for example, `us-east-1`.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 10 items.

Required: No

**SingleAvailabilityZone**

Specify `true` so that the response returns a list of scored Availability Zones. Otherwise, the response returns a list of scored Regions.

A list of scored Availability Zones is useful if you want to launch all of your Spot capacity into a single Availability Zone.

Type: Boolean

Required: No

**TargetCapacity**

The target capacity.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 2000000000.

Required: Yes

**TargetCapacityUnitType**

The unit for the target capacity.

Type: String

Valid Values: `vcpu | memory-mib | units`

Required: No

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

**requestId**

The ID of the request.

Type: String

**spotPlacementScoreSet**

The Spot placement score for the top 10 Regions or Availability Zones, scored on a scale from 1 to 10. Each score

reflects how likely it is that each Region or Availability Zone will succeed at fulfilling the specified target capacity
*at the time of the Spot placement score request*. A score of `10` means that your Spot capacity request is highly likely to succeed in that Region or Availability Zone.

If you request a Spot placement score for Regions, a high score assumes that your fleet request will be configured to use all Availability Zones and the `capacity-optimized` allocation strategy. If you request a Spot placement score for Availability Zones, a high score assumes that your fleet request will be configured to use a single Availability Zone and the `capacity-optimized` allocation strategy.

Different
Regions or Availability Zones might return the same score.

> **Note**
>
> The Spot placement score serves as a recommendation only. No score guarantees that your Spot request will be fully or partially fulfilled.

Type: Array of SpotPlacementScore objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetSubnetCidrReservations

Gets information about the subnet CIDR reservations.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters.

- `reservationType` - The type of reservation (`prefix` | `explicit`).
- `subnet-id` - The ID of the subnet.
- `tag:<key>` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.
- `tag-key` - The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**SubnetId**

The ID of the subnet.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**subnetIpv4CidrReservationSet**

Information about the IPv4 subnet CIDR reservations.

Type: Array of SubnetCidrReservation objects

**subnetIpv6CidrReservationSet**

Information about the IPv6 subnet CIDR reservations.

Type: Array of SubnetCidrReservation objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# GetTransitGatewayAttachmentPropagations

Lists the route tables to which the specified resource attachment propagates routes.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters. The possible values are:

- `transit-gateway-route-table-id` - The ID of the transit gateway route table.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**transitGatewayAttachmentPropagations**

Information about the propagation route tables.

Type: Array of TransitGatewayAttachmentPropagation objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# GetTransitGatewayMeteringPolicyEntries

Retrieves the entries for a transit gateway metering policy.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters to apply when retrieving metering policy entries.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayMeteringPolicyId**

The ID of the transit gateway metering policy to retrieve entries for.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**transitGatewayMeteringPolicyEntries**

Information about the transit gateway metering policy entries.

Type: Array of TransitGatewayMeteringPolicyEntry objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetTransitGatewayMulticastDomainAssociations

Gets information about the associations for the transit gateway multicast domain.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters. The possible values are:

- `resource-id` - The ID of the resource.
- `resource-type` - The type of resource. The valid value is: `vpc`.
- `state` - The state of the subnet association. Valid values are `associated` | `associating` | `disassociated` | `disassociating`.
- `subnet-id` - The ID of the subnet.
- `transit-gateway-attachment-id` - The id of the transit gateway attachment.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**multicastDomainAssociations**

Information about the multicast domain associations.

Type: Array of TransitGatewayMulticastDomainAssociation objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example 1

This example gets the multicast domain `tgw-attach-028c1dd0f8EXAMPLE` associations.

### Sample Request

```
https://ec2.amazonaws.com/?Action=GetTransitGatewayMulticastDomainAssociations
&TransitGatewayMulticastDomainId=tgw-attach-028c1dd0f8EXAMPLE
&AUTHPARAMS
```

### Sample Response

```
<GetTransitGatewayMulticastDomainAssociationsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>ca392437-3f6c-4193-92cd-24404EXAMPLE</requestId>
    <multicastDomainAssociations>
        <item>
            <resourceId>vpc-01128d2c24EXAMPLE</resourceId>
            <resourceType>vpc</resourceType>
            <subnet>
                <state>associated</state>
                <subnetId>subnet-000de86e3bEXAMPLE</subnetId>
            </subnet>
            <transitGatewayAttachmentId>tgw-attach-028c1dd0f8EXAMPLE</
transitGatewayAttachmentId>
        </item>
        <item>
            <resourceId>vpc-7EXAMPLE</resourceId>

# GetTransitGatewayPolicyTableAssociations

Gets a list of the transit gateway policy table associations.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

The filters associated with the transit gateway policy table.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayPolicyTableId**

The ID of the transit gateway policy table.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**associations**

Returns details about the transit gateway policy table association.

Type: Array of TransitGatewayPolicyTableAssociation objects

**nextToken**

The token for the next page of results.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# GetTransitGatewayPolicyTableEntries

Returns a list of transit gateway policy table entries.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

The filters associated with the transit gateway policy table.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayPolicyTableId**

The ID of the transit gateway policy table.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**transitGatewayPolicyTableEntries**

The entries for the transit gateway policy table.

Type: Array of TransitGatewayPolicyTableEntry objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetTransitGatewayPrefixListReferences

Gets information about the prefix list references in a specified transit gateway route table.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters. The possible values are:

- `attachment.resource-id` - The ID of the resource for the attachment.
- `attachment.resource-type` - The type of resource for the attachment. Valid values are `vpc` | `vpn` | `direct-connect-gateway` | `peering`.
- `attachment.transit-gateway-attachment-id` - The ID of the attachment.
- `is-blackhole` - Whether traffic matching the route is blocked (`true` | `false`).
- `prefix-list-id` - The ID of the prefix list.
- `prefix-list-owner-id` - The ID of the owner of the prefix list.
- `state` - The state of the prefix list reference (`pending` | `available` | `modifying` | `deleting`).

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**transitGatewayPrefixListReferenceSet**

Information about the prefix list references.

Type: Array of TransitGatewayPrefixListReference objects

# Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example gets the prefix list references for the specified transit gateway route table.

### Sample Request

```
https://ec2.amazonaws.com/?Action=GetTransitGatewayPrefixListReferences
&TransitGatewayRouteTableId=tgw-rtb-0f98a0a5d09abcabc
&AUTHPARAMS
```

### Sample Response

```
<GetTransitGatewayPrefixListReferencesResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>b194523f-807a-4a41-920a-example</requestId>
    <transitGatewayPrefixListReferenceSet>
        <item>
            <blackhole>false</blackhole>
            <prefixListId>pl-001122334455aabbc</prefixListId>
            <prefixListOwnerId>123456789012</prefixListOwnerId>
            <state>available</state>
            <transitGatewayAttachment>
                <resourceId>vpn-12312312312312312</resourceId>
                <resourceType>vpn</resourceType>
                <transitGatewayAttachmentId>tgw-attach-01234567abcabcabc</
transitGatewayAttachmentId>
            </transitGatewayAttachment>
            <transitGatewayRouteTableId>tgw-rtb-0f98a0a5d09abcabc</
transitGatewayRouteTableId>
        </item>
    </transitGatewayPrefixListReferenceSet>
</GetTransitGatewayPrefixListReferencesResponse>
```

# GetTransitGatewayRouteTableAssociations

Gets information about the associations for the specified transit gateway route table.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters. The possible values are:

- `resource-id` - The ID of the resource.
- `resource-type` - The resource type. Valid values are `vpc` | `vpn` | `direct-connect-gateway` | `peering` | `connect`.
- `transit-gateway-attachment-id` - The ID of the attachment.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**associations**

Information about the associations.

Type: Array of TransitGatewayRouteTableAssociation objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetTransitGatewayRouteTablePropagations

Gets information about the route table propagations for the specified transit gateway route table.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters. The possible values are:

- `resource-id` - The ID of the resource.
- `resource-type` - The resource type. Valid values are `vpc` | `vpn` | `direct-connect-gateway` | `peering` | `connect`.
- `transit-gateway-attachment-id` - The ID of the attachment.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**transitGatewayRouteTablePropagations**

Information about the route table propagations.

Type: Array of TransitGatewayRouteTablePropagation objects

## Errors

# GetVerifiedAccessEndpointPolicy

Get the Verified Access policy associated with the endpoint.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VerifiedAccessEndpointId**

The ID of the Verified Access endpoint.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**policyDocument**

The Verified Access policy document.

Type: String

**policyEnabled**

The status of the Verified Access policy.

Type: Boolean

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetVerifiedAccessEndpointTargets

Gets the targets for the specified network CIDR endpoint for Verified Access.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**VerifiedAccessEndpointId**

The ID of the network CIDR endpoint.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**verifiedAccessEndpointTargetSet**

The Verified Access targets.

Type: Array of VerifiedAccessEndpointTarget objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# GetVerifiedAccessGroupPolicy

Shows the contents of the Verified Access policy associated with the group.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VerifiedAccessGroupId**

The ID of the Verified Access group.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**policyDocument**

The Verified Access policy document.

Type: String

**policyEnabled**

The status of the Verified Access policy.

Type: Boolean

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# GetVpcResourcesBlockingEncryptionEnforcement

Gets information about resources in a VPC that are blocking encryption enforcement.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

**VpcId**

The ID of the VPC to check for resources blocking encryption enforcement.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

**nonCompliantResourceSet**

Information about resources that are blocking encryption enforcement.

Type: Array of VpcEncryptionNonCompliantResource objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# GetVpnConnectionDeviceSampleConfiguration

Download an AWS-provided sample configuration file to be used with the customer gateway device specified for your Site-to-Site VPN connection.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InternetKeyExchangeVersion**

The IKE version to be used in the sample configuration file for your customer gateway device. You can specify one of the following versions: `ikev1` or `ikev2`.

Type: String

Required: No

**SampleType**

The type of sample configuration to generate. Valid values are "compatibility" (includes IKEv1) or "recommended" (throws UnsupportedOperationException for IKEv1).

Type: String

Required: No

**VpnConnectionDeviceTypeId**

Device identifier provided by the `GetVpnConnectionDeviceTypes` API.

Type: String

Required: Yes

**VpnConnectionId**

The `VpnConnectionId` specifies the Site-to-Site VPN connection used for the sample configuration.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**vpnConnectionDeviceSampleConfiguration**

Sample configuration file for the specified customer gateway device.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3

- AWS SDK for Ruby V3

# GetVpnConnectionDeviceTypes

Obtain a list of customer gateway devices for which sample configuration files can be provided. The request has no additional parameters. You can also see the list of device types with sample configuration files available under Your customer gateway device in the *AWS Site-to-Site VPN User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxResults**

The maximum number of results returned by `GetVpnConnectionDeviceTypes` in paginated output. When this parameter is used, `GetVpnConnectionDeviceTypes` only returns `MaxResults` results in a single page along with a `NextToken` response element. The remaining results of the initial request can be seen by sending another `GetVpnConnectionDeviceTypes` request with the returned `NextToken` value. This value can be between 200 and 1000. If this parameter is not used, then `GetVpnConnectionDeviceTypes` returns all results.

Type: Integer

Valid Range: Minimum value of 200. Maximum value of 1000.

Required: No

**NextToken**

The `NextToken` value returned from a previous paginated `GetVpnConnectionDeviceTypes` request where `MaxResults` was used and the results exceeded the value of that parameter.

Pagination continues from the end of the previous results that returned the `NextToken` value. This value is null when there are no more results to return.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**nextToken**

The `NextToken` value to include in a future `GetVpnConnectionDeviceTypes` request. When the results of a `GetVpnConnectionDeviceTypes` request exceed `MaxResults`, this value can be used to retrieve the next page of results. This value is null when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**vpnConnectionDeviceTypeSet**

List of customer gateway devices that have a sample configuration file available for use.

Type: Array of VpnConnectionDeviceType objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# GetVpnTunnelReplacementStatus

Get details of available tunnel endpoint maintenance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VpnConnectionId**

The ID of the Site-to-Site VPN connection.

Type: String

Required: Yes

**VpnTunnelOutsideIpAddress**

The external IP address of the VPN tunnel.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**customerGatewayId**

The ID of the customer gateway.

Type: String

**maintenanceDetails**

Get details of pending tunnel endpoint maintenance.

Type: MaintenanceDetails object

**requestId**

The ID of the request.

Type: String

**transitGatewayId**

The ID of the transit gateway associated with the VPN connection.

Type: String

**vpnConnectionId**

The ID of the Site-to-Site VPN connection.

Type: String

**vpnGatewayId**

The ID of the virtual private gateway.

Type: String

**vpnTunnelOutsideIpAddress**

The external IP address of the VPN tunnel.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ImportClientVpnClientCertificateRevocationList

Uploads a client certificate revocation list to the specified Client VPN endpoint. Uploading a client certificate revocation list overwrites the existing client certificate revocation list.

Uploading a client certificate revocation list resets existing client connections.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CertificateRevocationList**

The client certificate revocation list file. For more information, see Generate a Client Certificate Revocation List in the *AWS Client VPN Administrator Guide*.

Type: String

Required: Yes

**ClientVpnEndpointId**

The ID of the Client VPN endpoint to which the client certificate revocation list applies.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

# ImportImage

**Note**

To import your virtual machines (VMs) with a console-based experience, you can use the *Import virtual machine images to AWS* template in the Migration Hub Orchestrator console. For more information, see the *AWS Migration Hub Orchestrator User Guide*.

Import single or multi-volume disk images or EBS snapshots into an Amazon Machine Image (AMI).

**Important**

AWS VM Import/Export strongly recommends specifying a value for either the `--license-type` or `--usage-operation` parameter when you create a new VM Import task. This ensures your operating system is licensed appropriately and your billing is optimized.

For more information, see Importing a VM as an image using VM Import/Export in the *VM Import/Export User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Architecture**

The architecture of the virtual machine.

Valid values: `i386` | `x86_64`

Type: String

Required: No

**BootMode**

The boot mode of the virtual machine.

> **Note**
>
> The `uefi-preferred` boot mode isn't supported for importing images. For more information, see Boot modes in the *VM Import/Export User Guide*.

Type: String

Valid Values: `legacy-bios | uefi | uefi-preferred`

Required: No

**ClientData**

The client-specific data.

Type: ClientData object

Required: No

**ClientToken**

The token to enable idempotency for VM import requests.

Type: String

Required: No

**Description**

A description string for the import image task.

Type: String

Required: No

**DiskContainer.N**

Information about the disk containers.

Type: Array of ImageDiskContainer objects

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Encrypted**

Specifies whether the destination AMI of the imported image should be encrypted. The default KMS key for EBS is used unless you specify a non-default KMS key using `KmsKeyId`. For more information, see Amazon EBS Encryption in the *Amazon Elastic Compute Cloud User Guide*.

Type: Boolean

Required: No

**Hypervisor**

The target hypervisor platform.

Valid values: `xen`

Type: String

Required: No

**KmsKeyId**

An identifier for the symmetric KMS key to use when creating the encrypted AMI. This parameter is only required if you want to use a non-default KMS key; if this parameter is not specified, the default KMS key for EBS is used. If a `KmsKeyId` is specified, the `Encrypted` flag must also be set.

The KMS key identifier may be provided in any of the following formats:

- Key ID
- Key alias
- ARN using key ID. The ID ARN contains the `arn:aws:kms` namespace, followed by the Region of the key, the AWS account ID of the key owner, the `key` namespace, and then the key

ID. For example, arn:aws:kms:*us-east-1*:*012345678910*:key/*abcd1234-a123-456a-a12b-a123b4cd56ef*.

- ARN using key alias. The alias ARN contains the `arn:aws:kms` namespace, followed by the Region of the key, the AWS account ID of the key owner, the `alias` namespace, and then the key alias. For example, arn:aws:kms:*us-east-1*:*012345678910*:alias/*ExampleAlias*.

AWS parses `KmsKeyId` asynchronously, meaning that the action you call may appear to complete even though you provided an invalid identifier. This action will eventually report failure.

The specified KMS key must exist in the Region that the AMI is being copied to.

Amazon EBS does not support asymmetric KMS keys.

Type: String

Required: No

**LicenseSpecifications.N**

The ARNs of the license configurations.

Type: Array of ImportImageLicenseConfigurationRequest objects

Required: No

**LicenseType**

The license type to be used for the Amazon Machine Image (AMI) after importing.

Specify `AWS` to replace the source-system license with an AWS license or `BYOL` to retain the source-system license. Leaving this parameter undefined is the same as choosing `AWS` when importing a Windows Server operating system, and the same as choosing `BYOL` when importing a Windows client operating system (such as Windows 10) or a Linux operating system.

To use `BYOL`, you must have existing licenses with rights to use these licenses in a third party cloud, such as AWS. For more information, see Prerequisites in the VM Import/Export User Guide.

Type: String

Required: No

**Platform**

The operating system of the virtual machine. If you import a VM that is compatible with Unified Extensible Firmware Interface (UEFI) using an EBS snapshot, you must specify a value for the platform.

Valid values: `Windows` | `Linux`

Type: String

Required: No

**RoleName**

The name of the role to use when not using the default role, 'vmimport'.

Type: String

Required: No

**TagSpecification.N**

The tags to apply to the import image task during creation.

Type: Array of TagSpecification objects

Required: No

**UsageOperation**

The usage operation value. For more information, see Licensing options in the *VM Import/Export User Guide*.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**architecture**

The architecture of the virtual machine.

Type: String

**description**

A description of the import task.

Type: String

**encrypted**

Indicates whether the AMI is encrypted.

Type: Boolean

**hypervisor**

The target hypervisor of the import task.

Type: String

**imageId**

The ID of the Amazon Machine Image (AMI) created by the import task.

Type: String

**importTaskId**

The task ID of the import image task.

Type: String

**kmsKeyId**

The identifier for the symmetric KMS key that was used to create the encrypted AMI.

Type: String

**licenseSpecifications**

The ARNs of the license configurations.

Type: Array of ImportImageLicenseConfigurationResponse objects

**licenseType**

The license type of the virtual machine.

Type: String

**platform**

The operating system of the virtual machine.

Type: String

**progress**

The progress of the task.

Type: String

**requestId**

The ID of the request.

Type: String

**snapshotDetailSet**

Information about the snapshots.

Type: Array of SnapshotDetail objects

**status**

A brief status of the task.

Type: String

**statusMessage**

A detailed status message of the import task.

Type: String

**tagSet**

Any tags assigned to the import image task.

Type: Array of Tag objects

**usageOperation**

The usage operation value.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ImportInstance

> **Note**
>
> We recommend that you use the `ImportImage` API instead. For more information, see Importing a VM as an image using VM Import/Export in the *VM Import/Export User Guide*.

Creates an import instance task using metadata from the specified disk image.

This API action supports only single-volume VMs. To import multi-volume VMs, use ImportImage instead.

For information about the import manifest referenced by this API action, see VM Import Manifest.

This API action is not supported by the AWS Command Line Interface (AWS CLI).

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Description**

A description for the instance being imported.

Type: String

Required: No

**DiskImage.N**

The disk image.

Type: Array of DiskImage objects

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**LaunchSpecification**

The launch specification.

Type: ImportInstanceLaunchSpecification object

Required: No

**Platform**

The instance operating system.

Type: String

Valid Values: `Windows`

Required: Yes

## Response Elements

The following elements are returned by the service.

**conversionTask**

Information about the conversion task.

Type: ConversionTask object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example creates an import instance task that migrates a Windows Server 2008 SP2 (32-bit) VM into the `us-east-1` Region.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ImportInstance
&LaunchSpecification.Architecture=x86_64
&LaunchSpecification.InstanceType=m1.xlarge
&DiskImage.1.Image.Format=VMDK
&DiskImage.1.Image.Bytes=1179593728
&DiskImage.1.Image.ImportManifestUrl=https://s3.amazonaws.com/amzn-s3-demo-
bucket/a3a5e1b6-590d-43cc-97c1-15c7325d3f41/Win_2008_Server_Data_Center_SP2_32-
bit.vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1294855591&
Signature=5snej01TlTtL0uR7KExtEXAMPLE%3D
&DiskImage.1.Volume.Size=12
&Platform=Windows
&AUTHPARAMS
```

### Sample Response

```
<ImportInstanceResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <conversionTask>
    <conversionTaskId>import-i-ffvko9js</conversionTaskId>
    <expirationTime>2010-12-22T12:01Z</expirationTime>
    <importInstance>
       <volumes>
          <item>
             <bytesConverted>0</bytesConverted>
             <availabilityZone>us-east-1a</availabilityZone>
             <image>
                <format>VMDK</format>
                <size>1179593728</size>
                <importManifestUrl>
                 https://s3.amazonaws.com/amzn-s3-demo-bucket/
a3a5e1b6-590d-43cc-97c1-15c7325d3f41/Win_2008_Server_Data_Center_SP2_32-bit.
vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1294855591&
Signature=5snej01TlTtL0uR7KExtEXAMPLE%3D
                </importManifestUrl>
```

```
            </image>
            <description/>
            <volume>
               <size>12</size>
               <id>vol-1234567890abcdef0</id>
            </volume>
            <status>active</status>
            <statusMessage/>
         </item>
      </volumes>
      <instanceId>i-1234567890abcdef0</instanceId>
      <description/>
   </importInstance>
  </conversionTask>
</ImportInstanceResponse>
```

# ImportKeyPair

Imports the public key from an RSA or ED25519 key pair that you created using a third-party tool. You give AWS only the public key. The private key is never transferred between you and AWS.

For more information about the requirements for importing a key pair, see Create a key pair and import the public key to Amazon EC2 in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**KeyName**

A unique name for the key pair.

Type: String

Required: Yes

**PublicKeyMaterial**

The public key.

Type: Base64-encoded binary data object

Required: Yes

**TagSpecification.N**

The tags to apply to the imported key pair.

Type: Array of TagSpecification objects

Required: No

## Response Elements

The following elements are returned by the service.

**keyFingerprint**

- For RSA key pairs, the key fingerprint is the MD5 public key fingerprint as specified in section 4 of RFC 4716.
- For ED25519 key pairs, the key fingerprint is the base64-encoded SHA-256 digest, which is the default for OpenSSH, starting with OpenSSH 6.8.

Type: String

**keyName**

The key pair name that you provided.

Type: String

**keyPairId**

The ID of the resulting key pair.

Type: String

**requestId**

The ID of the request.

Type: String

**tagSet**

The tags applied to the imported key pair.

Type: Array of Tag objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example imports the public key named `my-key-pair`, and applies a tag with a key of `purpose` and a value of `production`.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ImportKeyPair

# ImportSnapshot

Imports a disk into an EBS snapshot.

For more information, see Importing a disk as a snapshot using VM Import/Export in the *VM Import/Export User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientData**

The client-specific data.

Type: ClientData object

Required: No

**ClientToken**

Token to enable idempotency for VM import requests.

Type: String

Required: No

**Description**

The description string for the import snapshot task.

Type: String

Required: No

**DiskContainer**

Information about the disk container.

Type: SnapshotDiskContainer object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Encrypted**

Specifies whether the destination snapshot of the imported image should be encrypted. The default KMS key for EBS is used unless you specify a non-default KMS key using `KmsKeyId`. For more information, see Amazon EBS Encryption in the *Amazon Elastic Compute Cloud User Guide*.

Type: Boolean

Required: No

**KmsKeyId**

An identifier for the symmetric KMS key to use when creating the encrypted snapshot. This parameter is only required if you want to use a non-default KMS key; if this parameter is not specified, the default KMS key for EBS is used. If a `KmsKeyId` is specified, the `Encrypted` flag must also be set.

The KMS key identifier may be provided in any of the following formats:

- Key ID
- Key alias
- ARN using key ID. The ID ARN contains the `arn:aws:kms` namespace, followed by the Region of the key, the AWS account ID of the key owner, the `key` namespace, and then the key ID. For example, arn:aws:kms:*us-east-1*:*012345678910*:key/*abcd1234-a123-456a-a12b-a123b4cd56ef*.
- ARN using key alias. The alias ARN contains the `arn:aws:kms` namespace, followed by the Region of the key, the AWS account ID of the key owner, the `alias` namespace, and then the key alias. For example, arn:aws:kms:*us-east-1*:*012345678910*:alias/*ExampleAlias*.

AWS parses `KmsKeyId` asynchronously, meaning that the action you call may appear to complete even though you provided an invalid identifier. This action will eventually report failure.

The specified KMS key must exist in the Region that the snapshot is being copied to.

Amazon EBS does not support asymmetric KMS keys.

Type: String

Required: No

**RoleName**

The name of the role to use when not using the default role, 'vmimport'.

Type: String

Required: No

**TagSpecification.N**

The tags to apply to the import snapshot task during creation.

Type: Array of TagSpecification objects

Required: No

## Response Elements

The following elements are returned by the service.

**description**

A description of the import snapshot task.

Type: String

**importTaskId**

The ID of the import snapshot task.

Type: String

**requestId**

The ID of the request.

Type: String

**snapshotTaskDetail**

Information about the import snapshot task.

Type: SnapshotTaskDetail object

**tagSet**

Any tags assigned to the import snapshot task.

Type: Array of Tag objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ImportVolume

> **Note**
>
> This API action supports only single-volume VMs. To import multi-volume VMs, use ImportImage instead. To import a disk to a snapshot, use ImportSnapshot instead.

Creates an import volume task using metadata from the specified disk image.

For information about the import manifest referenced by this API action, see VM Import Manifest.

This API action is not supported by the AWS Command Line Interface (AWS CLI).

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AvailabilityZone**

The Availability Zone for the resulting EBS volume.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified, but not both.

Type: String

Required: No

**AvailabilityZoneId**

The ID of the Availability Zone for the resulting EBS volume.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified, but not both.

Type: String

Required: No

**Description**

A description of the volume.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Image**

The disk image.

Type: DiskImageDetail object

Required: Yes

**Volume**

The volume size.

Type: VolumeDetail object

Required: Yes

## Response Elements

The following elements are returned by the service.

**conversionTask**

Information about the conversion task.

Type: ConversionTask object

**requestId**

The ID of the request.

Type: String

# Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example creates an import volume task that migrates a Windows Server 2008 SP2 (32-bit) volume into the `us-east-1` Region.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ImportVolume
&AvailabilityZone=us-east-1c
&Image.Format=VMDK
&Image.Bytes=128696320
&Image.ImportManifestUrl=https://s3.amazonaws.com/amzn-s3-demo-bucket/
a3a5e1b6-590d-43cc-97c1-15c7325d3f41/Win_2008_Server_Data_Center_SP2_32-bit.
vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1294855591&
Signature=5snej01TlTtL0uR7KExtEXAMPLE%3D
&Volume.Size=8
&AUTHPARAMS>
```

### Sample Response

```
<ImportVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <conversionTask>
     <conversionTaskId>import-i-fh95npoc</conversionTaskId>
     <expirationTime>2010-12-22T12:01Z</expirationTime>
     <importVolume>
        <bytesConverted>0</bytesConverted>
        <availabilityZone>us-east-1c</availabilityZone>
        <description/>
        <image>
            <format>VDMK</format>
            <size>128696320</size>
            <importManifestUrl>
               https://s3.amazonaws.com/amzn-s3-demo-bucket/
a3a5e1b6-590d-43cc-97c1-15c7325d3f41/Win_2008_Server_Data_Center_SP2_32-bit.
vmdkmanifest.xml?AWSAccessKeyId=AKIAIOSFODNN7EXAMPLE&Expires=1294855591&
Signature=5snej01TlTtL0uR7KExtEXAMPLE%3D
```

```
            </importManifestUrl>
            <checksum>ccb1b0536a4a70e86016b85229b5c6b10b14a4eb</checksum>
         </image>
         <volume>
            <size>8</size>
            <id>vol-1234567890abcdef0</id>
         </volume>
      </importVolume>
      <state>active</state>
      <statusMessage/>
   </conversionTask>
</ImportVolumeResponse>
```

# ListImagesInRecycleBin

Lists one or more AMIs that are currently in the Recycle Bin. For more information, see Recycle Bin in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ImageId.N**

The IDs of the AMIs to list. Omit this parameter to list all of the AMIs that are in the Recycle Bin. You can specify up to 20 IDs in a single request.

Type: Array of strings

Required: No

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 1000.

Required: No

**NextToken**

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**imageSet**

Information about the AMIs.

Type: Array of ImageRecycleBinInfo objects

**nextToken**

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ListSnapshotsInRecycleBin

Lists one or more snapshots that are currently in the Recycle Bin.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

**SnapshotId.N**

The IDs of the snapshots to list. Omit this parameter to list all of the snapshots that are in the Recycle Bin.

Type: Array of strings

Required: No

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

**requestId**

The ID of the request.

Type: String

**snapshotSet**

Information about the snapshots.

Type: Array of SnapshotRecycleBinInfo objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ListVolumesInRecycleBin

Lists one or more volumes that are currently in the Recycle Bin.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxResults**

The maximum number of items to return for this request. To get the next page of items, make another request with the token returned in the output. For more information, see Pagination.

Valid range: 5 - 500

Type: Integer

Required: No

**NextToken**

The token returned from a previous paginated request. Pagination continues from the end of the items returned by the previous request.

Type: String

Required: No

**VolumeId.N**

The IDs of the volumes to list. Omit this parameter to list all of the volumes that are in the Recycle Bin.

Type: Array of strings

Required: No

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to include in another request to get the next page of items. This value is `null` when there are no more items to return.

Type: String

**requestId**

The ID of the request.

Type: String

**volumeSet**

Information about the volumes.

Type: Array of VolumeRecycleBinInfo objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# LockSnapshot

Locks an Amazon EBS snapshot in either *governance* or *compliance* mode to protect it against accidental or malicious deletions for a specific duration. A locked snapshot can't be deleted.

You can also use this action to modify the lock settings for a snapshot that is already locked. The allowed modifications depend on the lock mode and lock state:

- If the snapshot is locked in governance mode, you can modify the lock mode and the lock duration or lock expiration date.
- If the snapshot is locked in compliance mode and it is in the cooling-off period, you can modify the lock mode and the lock duration or lock expiration date.
- If the snapshot is locked in compliance mode and the cooling-off period has lapsed, you can only increase the lock duration or extend the lock expiration date.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CoolOffPeriod**

The cooling-off period during which you can unlock the snapshot or modify the lock settings after locking the snapshot in compliance mode, in hours. After the cooling-off period expires, you can't unlock or delete the snapshot, decrease the lock duration, or change the lock mode. You can increase the lock duration after the cooling-off period expires.

The cooling-off period is optional when locking a snapshot in compliance mode. If you are locking the snapshot in governance mode, omit this parameter.

To lock the snapshot in compliance mode immediately without a cooling-off period, omit this parameter.

If you are extending the lock duration for a snapshot that is locked in compliance mode after the cooling-off period has expired, omit this parameter. If you specify a cooling-period in a such a request, the request fails.

Allowed values: Min 1, max 72.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 72.

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ExpirationDate**

The date and time at which the snapshot lock is to automatically expire, in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`).

You must specify either this parameter or **LockDuration**, but not both.

Type: Timestamp

Required: No

**LockDuration**

The period of time for which to lock the snapshot, in days. The snapshot lock will automatically expire after this period lapses.

You must specify either this parameter or **ExpirationDate**, but not both.

Allowed values: Min: 1, max 36500

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 36500.

Required: No

**LockMode**

The mode in which to lock the snapshot. Specify one of the following:

- `governance` - Locks the snapshot in governance mode. Snapshots locked in governance mode can't be deleted until one of the following conditions are met:

- The lock duration expires.
- The snapshot is unlocked by a user with the appropriate permissions.

Users with the appropriate IAM permissions can unlock the snapshot, increase or decrease the lock duration, and change the lock mode to `compliance` at any time.

If you lock a snapshot in `governance` mode, omit **CoolOffPeriod**.

- `compliance` - Locks the snapshot in compliance mode. Snapshots locked in compliance mode can't be unlocked by any user. They can be deleted only after the lock duration expires. Users can't decrease the lock duration or change the lock mode to `governance`. However, users with appropriate IAM permissions can increase the lock duration at any time.

  If you lock a snapshot in `compliance` mode, you can optionally specify **CoolOffPeriod**.

Type: String

Valid Values: `compliance | governance`

Required: Yes

**SnapshotId**

The ID of the snapshot to lock.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**coolOffPeriod**

The compliance mode cooling-off period, in hours.

Type: Integer

**coolOffPeriodExpiresOn**

The date and time at which the compliance mode cooling-off period expires, in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`).

Type: Timestamp

**lockCreatedOn**

The date and time at which the snapshot was locked, in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`).

Type: Timestamp

**lockDuration**

The period of time for which the snapshot is locked, in days.

Type: Integer

**lockDurationStartTime**

The date and time at which the lock duration started, in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`).

Type: Timestamp

**lockExpiresOn**

The date and time at which the lock will expire, in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`).

Type: Timestamp

**lockState**

The state of the snapshot lock. Valid states include:

- `compliance-cooloff` - The snapshot has been locked in compliance mode but it is still within the cooling-off period. The snapshot can't be deleted, but it can be unlocked and the lock settings can be modified by users with appropriate permissions.
- `governance` - The snapshot is locked in governance mode. The snapshot can't be deleted, but it can be unlocked and the lock settings can be modified by users with appropriate permissions.
- `compliance` - The snapshot is locked in compliance mode and the cooling-off period has expired. The snapshot can't be unlocked or deleted. The lock duration can only be increased by users with appropriate permissions.
- `expired` - The snapshot was locked in compliance or governance mode but the lock duration has expired. The snapshot is not locked and can be deleted.

Type: String

Valid Values: `compliance | governance | compliance-cooloff | expired`

**requestId**

The ID of the request.

Type: String

**snapshotId**

The ID of the snapshot

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ModifyAddressAttribute

Modifies an attribute of the specified Elastic IP address. For requirements, see Using reverse DNS for email applications.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AllocationId**

[EC2-VPC] The allocation ID.

Type: String

Required: Yes

**DomainName**

The domain name to modify for the IP address.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**address**

Information about the Elastic IP address.

Type: AddressAttribute object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyAvailabilityZoneGroup

Changes the opt-in status of the specified zone group for your account.

Use DescribeAvailabilityZones to view the value for `GroupName`.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**GroupName**

The name of the Availability Zone group, Local Zone group, or Wavelength Zone group.

Type: String

Required: Yes

**OptInStatus**

Indicates whether to opt in to the zone group. The only valid value is `opted-in`. You must contact AWS Support to opt out of a Local Zone or Wavelength Zone group.

Type: String

Valid Values: `opted-in | not-opted-in`

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyCapacityReservation

Modifies a Capacity Reservation's capacity, instance eligibility, and the conditions under which it is to be released. You can't modify a Capacity Reservation's instance type, EBS optimization, platform, instance store settings, Availability Zone, or tenancy. If you need to modify any of these attributes, we recommend that you cancel the Capacity Reservation, and then create a new one with the required attributes. For more information, see Modify an active Capacity Reservation.

The allowed modifications depend on the state of the Capacity Reservation:

- `assessing` or `scheduled` state - You can modify the tags only.
- `pending` state - You can't modify the Capacity Reservation in any way.
- `active` state but still within the commitment duration - You can't decrease the instance count or set an end date that is within the commitment duration. All other modifications are allowed.
- `active` state with no commitment duration or elapsed commitment duration - All modifications are allowed.
- `expired`, `cancelled`, `unsupported`, or `failed` state - You can't modify the Capacity Reservation in any way.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Accept**

Reserved. Capacity Reservations you have created are accepted by default.

Type: Boolean

Required: No

**AdditionalInfo**

Reserved for future use.

Type: String

Required: No

**CapacityReservationId**

The ID of the Capacity Reservation.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EndDate**

The date and time at which the Capacity Reservation expires. When a Capacity Reservation expires, the reserved capacity is released and you can no longer launch instances into it. The Capacity Reservation's state changes to `expired` when it reaches its end date and time.

The Capacity Reservation is cancelled within an hour from the specified time. For example, if you specify 5/31/2019, 13:30:55, the Capacity Reservation is guaranteed to end between 13:30:55 and 14:30:55 on 5/31/2019.

You must provide an `EndDate` value if `EndDateType` is `limited`. Omit `EndDate` if `EndDateType` is `unlimited`.

Type: Timestamp

Required: No

**EndDateType**

Indicates the way in which the Capacity Reservation ends. A Capacity Reservation can have one of the following end types:

- `unlimited` - The Capacity Reservation remains active until you explicitly cancel it. Do not provide an `EndDate` value if `EndDateType` is `unlimited`.
- `limited` - The Capacity Reservation expires automatically at a specified date and time. You must provide an `EndDate` value if `EndDateType` is `limited`.

Type: String

Valid Values: `unlimited | limited`

Required: No

**InstanceCount**

The number of instances for which to reserve capacity. The number of instances can't be increased or decreased by more than `1000` in a single request.

Type: Integer

Required: No

**InstanceMatchCriteria**

The matching criteria (instance eligibility) that you want to use in the modified Capacity Reservation. If you change the instance eligibility of an existing Capacity Reservation from `targeted` to `open`, any running instances that match the attributes of the Capacity Reservation, have the `CapacityReservationPreference` set to `open`, and are not yet running in the Capacity Reservation, will automatically use the modified Capacity Reservation.

To modify the instance eligibility, the Capacity Reservation must be completely idle (zero usage).

Type: String

Valid Values: `open | targeted`

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyCapacityReservationFleet

Modifies a Capacity Reservation Fleet.

When you modify the total target capacity of a Capacity Reservation Fleet, the Fleet automatically creates new Capacity Reservations, or modifies or cancels existing Capacity Reservations in the Fleet to meet the new total target capacity. When you modify the end date for the Fleet, the end dates for all of the individual Capacity Reservations in the Fleet are updated accordingly.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CapacityReservationFleetId**

The ID of the Capacity Reservation Fleet to modify.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EndDate**

The date and time at which the Capacity Reservation Fleet expires. When the Capacity Reservation Fleet expires, its state changes to `expired` and all of the Capacity Reservations in the Fleet expire.

The Capacity Reservation Fleet expires within an hour after the specified time. For example, if you specify `5/31/2019`, `13:30:55`, the Capacity Reservation Fleet is guaranteed to expire between `13:30:55` and `14:30:55` on `5/31/2019`.

You can't specify **EndDate** and **RemoveEndDate** in the same request.

Type: Timestamp

Required: No

**RemoveEndDate**

Indicates whether to remove the end date from the Capacity Reservation Fleet. If you remove the end date, the Capacity Reservation Fleet does not expire and it remains active until you explicitly cancel it using the **CancelCapacityReservationFleet** action.

You can't specify **RemoveEndDate** and **EndDate** in the same request.

Type: Boolean

Required: No

**TotalTargetCapacity**

The total number of capacity units to be reserved by the Capacity Reservation Fleet. This value, together with the instance type weights that you assign to each instance type used by the Fleet determine the number of instances for which the Fleet reserves capacity. Both values are based on units that make sense for your workload. For more information, see Total target capacity in the *Amazon EC2 User Guide*.

Type: Integer

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyClientVpnEndpoint

Modifies the specified Client VPN endpoint. Modifying the DNS server resets existing client connections.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientConnectOptions**

The options for managing connection authorization for new client connections.

Type: ClientConnectOptions object

Required: No

**ClientLoginBannerOptions**

Options for enabling a customizable text banner that will be displayed on AWS provided clients when a VPN session is established.

Type: ClientLoginBannerOptions object

Required: No

**ClientRouteEnforcementOptions**

Client route enforcement is a feature of the Client VPN service that helps enforce administrator defined routes on devices connected through the VPN. T his feature helps improve your security posture by ensuring that network traffic originating from a connected client is not inadvertently sent outside the VPN tunnel.

Client route enforcement works by monitoring the route table of a connected device for routing policy changes to the VPN connection. If the feature detects any VPN routing policy modifications, it will automatically force an update to the route table, reverting it back to the expected route configurations.

Type: ClientRouteEnforcementOptions object

Required: No

**ClientVpnEndpointId**

The ID of the Client VPN endpoint to modify.

Type: String

Required: Yes

**ConnectionLogOptions**

Information about the client connection logging options.

If you enable client connection logging, data about client connections is sent to a Cloudwatch Logs log stream. The following information is logged:

- Client connection requests
- Client connection results (successful and unsuccessful)
- Reasons for unsuccessful client connection requests
- Client connection termination time

Type: ConnectionLogOptions object

Required: No

**Description**

A brief description of the Client VPN endpoint.

Type: String

Required: No

**DisconnectOnSessionTimeout**

Indicates whether the client VPN session is disconnected after the maximum timeout specified in `sessionTimeoutHours` is reached. If `true`, users are prompted to reconnect client VPN. If `false`, client VPN attempts to reconnect automatically. The default value is `true`.

Type: Boolean

Required: No

**DnsServers**

Information about the DNS servers to be used by Client VPN connections. A Client VPN endpoint can have up to two DNS servers.

Type: DnsServersOptionsModifyStructure object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**SecurityGroupId.N**

The IDs of one or more security groups to apply to the target network.

Type: Array of strings

Required: No

**SelfServicePortal**

Specify whether to enable the self-service portal for the Client VPN endpoint.

Type: String

Valid Values: `enabled | disabled`

Required: No

**ServerCertificateArn**

The ARN of the server certificate to be used. The server certificate must be provisioned in AWS Certificate Manager (ACM).

Type: String

Required: No

**SessionTimeoutHours**

The maximum VPN session duration time in hours.

Valid values: 8 | 10 | 12 | 24

Default value: 24

Type: Integer

Required: No

**SplitTunnel**

Indicates whether the VPN is split-tunnel.

For information about split-tunnel VPN endpoints, see Split-tunnel AWS Client VPN endpoint in the *AWS Client VPN Administrator Guide*.

Type: Boolean

Required: No

**TransitGatewayConfiguration**

The Transit Gateway configuration for the Client VPN endpoint. This option is currently not supported.

Type: TransitGatewayConfigurationInputStructure object

Required: No

**VpcId**

The ID of the VPC to associate with the Client VPN endpoint.

Type: String

Required: No

**VpnPort**

The port number to assign to the Client VPN endpoint for TCP and UDP traffic.

Valid Values: 443 | 1194

Default Value: 443

Type: Integer

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example modifies a Client VPN endpoint's description.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyClientVpnEndpoint
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&Description=my-client-vpn-endpoint
&AUTHPARAMS
```

#### Sample Response

```
<ModifyClientVpnEndpointResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>fe4813d3-1e79-4f67-bbd7-3186eEXAMPLE</requestId>
    <return>true</return>
```

```
</ModifyClientVpnEndpointResponse>
```

# ModifyDefaultCreditSpecification

Modifies the default credit option for CPU usage of burstable performance instances. The default credit option is set at the account level per AWS Region, and is specified per instance family. All new burstable performance instances in the account launch using the default credit option.

`ModifyDefaultCreditSpecification` is an asynchronous operation, which works at an AWS Region level and modifies the credit option for each Availability Zone. All zones in a Region are updated within five minutes. But if instances are launched during this operation, they might not get the new credit option until the zone is updated. To verify whether the update has occurred, you can call `GetDefaultCreditSpecification` and check `DefaultCreditSpecification` for updates.

For more information, see Burstable performance instances in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CpuCredits**

The credit option for CPU usage of the instance family.

Valid Values: `standard` | `unlimited`

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceFamily**

The instance family.

Type: String

Valid Values: `t2 | t3 | t3a | t4g`

Required: Yes

## Response Elements

The following elements are returned by the service.

**instanceFamilyCreditSpecification**

The default credit option for CPU usage of the instance family.

Type: InstanceFamilyCreditSpecification object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example modifies the default credit option for CPU usage to `unlimited` for all instances in the T2 instance family in the specified Region.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyDefaultCreditSpecification
&Region=us-east-1
&InstanceFamily=t2
&CpuCredits=unlimited
&AUTHPARAMS
```

### Sample Response

```
<ModifyDefaultCreditSpecificationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>11111111-2222-3333-4444-5555EXAMPLE</requestId>
    <instanceFamilyCreditSpecification>
        <cpuCredits>unlimited</cpuCredits>
        <instanceFamily>t2</instanceFamily>
    </instanceFamilyCreditSpecification>
</ModifyDefaultCreditSpecificationResponse>
```

## Example 2

This example modifies the default credit option for CPU usage to `standard` for all instances in the T3 instance family in the specified Region.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyDefaultCreditSpecification
&Region=us-east-1
&InstanceFamily=t3
&CpuCredits=standard
&AUTHPARAMS
```

### Sample Response

```
<ModifyDefaultCreditSpecificationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>11111111-2222-3333-4444-5555EXAMPLE</requestId>
    <instanceFamilyCreditSpecification>
        <cpuCredits>standard</cpuCredits>
        <instanceFamily>t3</instanceFamily>
    </instanceFamilyCreditSpecification>
</ModifyDefaultCreditSpecificationResponse>
```

# ModifyEbsDefaultKmsKeyId

Changes the default AWS KMS key for EBS encryption by default for your account in this Region.

AWS creates a unique AWS managed KMS key in each Region for use with encryption by default. If you change the default KMS key to a symmetric customer managed KMS key, it is used instead of the AWS managed KMS key. Amazon EBS does not support asymmetric KMS keys.

To reset the default KMS key to the AWS managed KMS key for EBS, use ResetEbsDefaultKmsKeyId.

If you delete or disable the customer managed KMS key that you specified for use with encryption by default, your instances will fail to launch.

For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**KmsKeyId**

The identifier of the AWS KMS key to use for Amazon EBS encryption. If this parameter is not specified, your AWS KMS key for Amazon EBS is used. If `KmsKeyId` is specified, the encrypted state must be `true`.

You can specify the KMS key using any of the following:

- Key ID. For example, 1234abcd-12ab-34cd-56ef-1234567890ab.
- Key alias. For example, alias/ExampleAlias.
- Key ARN. For example, arn:aws:kms:us-east-1:012345678910:key/1234abcd-12ab-34cd-56ef-1234567890ab.

- Alias ARN. For example, arn:aws:kms:us-east-1:012345678910:alias/ExampleAlias.

AWS authenticates the KMS key asynchronously. Therefore, if you specify an ID, alias, or ARN that is not valid, the action can appear to complete, but eventually fails.

Amazon EBS does not support asymmetric KMS keys.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**kmsKeyId**

The Amazon Resource Name (ARN) of the default KMS key for encryption by default.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ModifyFleet

Modifies the specified EC2 Fleet.

You can only modify an EC2 Fleet request of type `maintain`.

While the EC2 Fleet is being modified, it is in the `modifying` state.

To scale up your EC2 Fleet, increase its target capacity. The EC2 Fleet launches the additional Spot Instances according to the allocation strategy for the EC2 Fleet request. If the allocation strategy is `lowest-price`, the EC2 Fleet launches instances using the Spot Instance pool with the lowest price. If the allocation strategy is `diversified`, the EC2 Fleet distributes the instances across the Spot Instance pools. If the allocation strategy is `capacity-optimized`, EC2 Fleet launches instances from Spot Instance pools with optimal capacity for the number of instances that are launching.

To scale down your EC2 Fleet, decrease its target capacity. First, the EC2 Fleet cancels any open requests that exceed the new target capacity. You can request that the EC2 Fleet terminate Spot Instances until the size of the fleet no longer exceeds the new target capacity. If the allocation strategy is `lowest-price`, the EC2 Fleet terminates the instances with the highest price per unit. If the allocation strategy is `capacity-optimized`, the EC2 Fleet terminates the instances in the Spot Instance pools that have the least available Spot Instance capacity. If the allocation strategy is `diversified`, the EC2 Fleet terminates instances across the Spot Instance pools. Alternatively, you can request that the EC2 Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or that you terminate manually.

If you are finished with your EC2 Fleet for now, but will use it again later, you can set the target capacity to 0.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Context**

Reserved.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ExcessCapacityTerminationPolicy**

Indicates whether running instances should be terminated if the total target capacity of the EC2 Fleet is decreased below the current size of the EC2 Fleet.

Supported only for fleets of type `maintain`.

Type: String

Valid Values: `no-termination | termination`

Required: No

**FleetId**

The ID of the EC2 Fleet.

Type: String

Required: Yes

**LaunchTemplateConfig.N**

The launch template and overrides.

Type: Array of FleetLaunchTemplateConfigRequest objects

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: No

**TargetCapacitySpecification**

The size of the EC2 Fleet.

Type: TargetCapacitySpecificationRequest object

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

If the request succeeds, the response returns `true`. If the request fails, no response is returned, and instead an error message is returned.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyFpgaImageAttribute

Modifies the specified attribute of the specified Amazon FPGA Image (AFI).

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Attribute**

The name of the attribute.

Type: String

Valid Values: `description | name | loadPermission | productCodes`

Required: No

**Description**

A description for the AFI.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**FpgaImageId**

The ID of the AFI.

Type: String

Required: Yes

**LoadPermission**

The load permission for the AFI.

Type: LoadPermissionModifications object

Required: No

**Name**

A name for the AFI.

Type: String

Required: No

**OperationType**

The operation type.

Type: String

Valid Values: `add | remove`

Required: No

**ProductCode.N**

The product codes. After you add a product code to an AFI, it can't be removed. This parameter is valid only when modifying the `productCodes` attribute.

Type: Array of strings

Required: No

**UserGroup.N**

The user groups. This parameter is valid only when modifying the `loadPermission` attribute.

Type: Array of strings

Required: No

**UserId.N**

The AWS account IDs. This parameter is valid only when modifying the `loadPermission` attribute.

Type: Array of strings

Required: No

## Response Elements

The following elements are returned by the service.

**fpgaImageAttribute**

Information about the attribute.

Type: FpgaImageAttribute object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example adds load permissions for account ID 123456789012.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=ModifyFpgaImageAttribute
&FpgaImageId=afi-0d123e21abcc85abc
&Attribute=loadPermission
&LoadPermission.Add.1.UserId=123456789012
&AUTHPARAMS
```

**Sample Response**

```
<ModifyFpgaImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
```

```
    <requestId>75837959-edf9-4183-ad01-6cb1example</requestId>
    <fpgaImageAttribute>
        <fpgaImageId>afi-0d123e21abcc85abc</fpgaImageId>
        <loadPermissions>
            <item>
                <userId>123456789012</userId>
            </item>
        </loadPermissions>
    </fpgaImageAttribute>
</ModifyFpgaImageAttributeResponse>
```

# ModifyHosts

Modify the auto-placement setting of a Dedicated Host. When auto-placement is enabled, any instances that you launch with a tenancy of `host` but without a specific host ID are placed onto any available Dedicated Host in your account that has auto-placement enabled. When auto-placement is disabled, you need to provide a host ID to have the instance launch onto a specific host. If no host ID is provided, the instance is launched onto a suitable host with auto-placement enabled.

You can also use this API action to modify a Dedicated Host to support either multiple instance types in an instance family, or to support a specific instance type only.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AutoPlacement**

Specify whether to enable or disable auto-placement.

Type: String

Valid Values: `on` | `off`

Required: No

**HostId.N**

The IDs of the Dedicated Hosts to modify.

Type: Array of strings

Required: Yes

**HostMaintenance**

Indicates whether to enable or disable host maintenance for the Dedicated Host. For more information, see Host maintenance in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `on` | `off`

Required: No

**HostRecovery**

Indicates whether to enable or disable host recovery for the Dedicated Host. For more information, see Host recovery in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `on | off`

Required: No

**InstanceFamily**

Specifies the instance family to be supported by the Dedicated Host. Specify this parameter to modify a Dedicated Host to support multiple instance types within its current instance family.

If you want to modify a Dedicated Host to support a specific instance type only, omit this parameter and specify **InstanceType** instead. You cannot specify **InstanceFamily** and **InstanceType** in the same request.

Type: String

Required: No

**InstanceType**

Specifies the instance type to be supported by the Dedicated Host. Specify this parameter to modify a Dedicated Host to support only a specific instance type.

If you want to modify a Dedicated Host to support multiple instance types in its current instance family, omit this parameter and specify **InstanceFamily** instead. You cannot specify **InstanceType** and **InstanceFamily** in the same request.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**successful**

The IDs of the Dedicated Hosts that were successfully modified.

Type: Array of strings

**unsuccessful**

The IDs of the Dedicated Hosts that could not be modified. Check whether the setting you requested can be used.

Type: Array of UnsuccessfulItem objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example enables the auto-placement setting on a Dedicated Host.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyHosts
&AutoPlacement=on
&HostId=h-00548908djdsgfs
&AUTHPARAMS
```

#### Sample Response

```
<ModifyHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <unsuccessful/>
    <successful>
```

```
        <item>h-00548908djdsgfs</item>
    </successful>
</ModifyHostsResponse>
```

## Example 2

This example enables host recovery on a Dedicated Host.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyHosts
&HostRecovery=on
&HostId=h-00548908djdsgfs
&AUTHPARAMS
```

### Sample Response

```
<ModifyHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <unsuccessful/>
    <successful>
        <item>h-00548908djdsgfs</item>
    </successful>
</ModifyHostsResponse>
```

## Example 3

This example modifies a Dedicated Host that supports only `m5.large` instances to support multiple instance types in the `m5` instance family.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyHosts
&InstanceFamily=m5
&HostId=h-00548908djdsgfs
&AUTHPARAMS
```

### Sample Response

```
<ModifyHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
```

```
    <unsuccessful/>
    <successful>
        <item>h-00548908djdsgfs</item>
    </successful>
</ModifyHostsResponse>
```

# ModifyIdentityIdFormat

Modifies the ID format of a resource for a specified IAM user, IAM role, or the root user for an account; or all IAM users, IAM roles, and the root user for an account. You can specify that resources should receive longer IDs (17-character IDs) when they are created.

This request can only be used to modify longer ID settings for resource types that are within the opt-in period. Resources currently in their opt-in period include: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `route-table` | `route-table-association` | `security-group` | `subnet` | `subnet-cidr-block-association` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`.

For more information, see Resource IDs in the *Amazon Elastic Compute Cloud User Guide*.

This setting applies to the principal specified in the request; it does not apply to the principal that makes the request.

Resources created with longer IDs are visible to all IAM roles and users, regardless of these settings and provided that they have permission to use the relevant `Describe` command for the resource type.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**PrincipalArn**

The ARN of the principal, which can be an IAM user, IAM role, or the root user. Specify `all` to modify the ID format for all IAM users, IAM roles, and the root user of the account.

Type: String

Required: Yes

**Resource**

The type of resource: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` |

`image` | `import-task` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `route-table` | `route-table-association` | `security-group` | `subnet` | `subnet-cidr-block-association` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`.

Alternatively, use the `all-current` option to include all resource types that are currently within their opt-in period for longer IDs.

Type: String

Required: Yes

**UseLongIds**

Indicates whether the resource should use longer IDs (17-character IDs)

Type: Boolean

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example sets the UseLongIds parameter to true for instances launched by the IAM role 'EC2Role'. Instances launched by the IAM role receive longer IDs.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyIdentityFormat
&Resource=instance
&UseLongIds=true
&PrincipalArn=arn:aws:iam::123456789012:role/EC2Role
&AUTHPARAMS
```

### Sample Response

```
<ModifyIdentityIdFormatResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>92c1af09-cb4c-410e-8a96-EXAMPLE</requestId>
  <return>true</return>
</ModifyIdentityIdFormatResponse>
```

# See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyIdFormat

Modifies the ID format for the specified resource on a per-Region basis. You can specify that resources should receive longer IDs (17-character IDs) when they are created.

This request can only be used to modify longer ID settings for resource types that are within the opt-in period. Resources currently in their opt-in period include: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `route-table` | `route-table-association` | `security-group` | `subnet` | `subnet-cidr-block-association` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`.

This setting applies to the IAM user who makes the request; it does not apply to the entire AWS account. By default, an IAM user defaults to the same settings as the root user. If you're using this action as the root user, then these settings apply to the entire account, unless an IAM user explicitly overrides these settings for themselves. For more information, see Resource IDs in the *Amazon Elastic Compute Cloud User Guide*.

Resources created with longer IDs are visible to all IAM roles and users, regardless of these settings and provided that they have permission to use the relevant `Describe` command for the resource type.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Resource**

The type of resource: `bundle` | `conversion-task` | `customer-gateway` | `dhcp-options` | `elastic-ip-allocation` | `elastic-ip-association` | `export-task` | `flow-log` | `image` | `import-task` | `internet-gateway` | `network-acl` | `network-acl-association` | `network-interface` | `network-interface-attachment` | `prefix-list` | `route-table` | `route-table-association` | `security-group` | `subnet` | `subnet-cidr-block-association` | `vpc` | `vpc-cidr-block-association` | `vpc-endpoint` | `vpc-peering-connection` | `vpn-connection` | `vpn-gateway`.

Alternatively, use the `all-current` option to include all resource types that are currently within their opt-in period for longer IDs.

Type: String

Required: Yes

**UseLongIds**

Indicate whether the resource should use longer IDs (17-character IDs).

Type: Boolean

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example sets the UseLongIds parameter to true for instances, so that instances you launch receive longer IDs.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyIdFormat
&Resource=instance
&UseLongIds=true
&AUTHPARAMS
```

### Sample Response

```
<ModifyIdFormatResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>92c1af09-cb4c-410e-8a96-EXAMPLE</requestId>
    <return>true</return>
</ModifyIdFormatResponse>
```

# ModifyImageAttribute

Modifies the specified attribute of the specified AMI. You can specify only one attribute at a time.

To specify the attribute, you can use the `Attribute` parameter, or one of the following parameters: `Description`, `ImdsSupport`, or `LaunchPermission`.

Images with an AWS Marketplace product code cannot be made public.

To enable the SriovNetSupport enhanced networking attribute of an image, enable SriovNetSupport on an instance and create an AMI from the instance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Attribute**

The name of the attribute to modify.

Valid values: `description` | `imdsSupport` | `launchPermission`

Type: String

Required: No

**Description**

A new description for the AMI.

Type: AttributeValue object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ImageId**

The ID of the AMI.

Type: String

Required: Yes

**ImdsSupport**

Set to `v2.0` to indicate that IMDSv2 is specified in the AMI. Instances launched from this AMI will have `HttpTokens` automatically set to `required` so that, by default, the instance requires that IMDSv2 is used when requesting instance metadata. In addition, `HttpPutResponseHopLimit` is set to 2. For more information, see Configure the AMI in the *Amazon EC2 User Guide*.

> **Important**
>
> Do not use this parameter unless your AMI software supports IMDSv2. After you set the value to `v2.0`, you can't undo it. The only way to "reset" your AMI is to create a new AMI from the underlying snapshot.

Type: AttributeValue object

Required: No

**LaunchPermission**

A new launch permission for the AMI.

Type: LaunchPermissionModifications object

Required: No

**OperationType**

The operation type. This parameter can be used only when the `Attribute` parameter is `launchPermission`.

Type: String

Valid Values: `add` | `remove`

Required: No

**OrganizationalUnitArn.N**

The Amazon Resource Name (ARN) of an organizational unit (OU). This parameter can be used only when the `Attribute` parameter is `launchPermission`.

Type: Array of strings

Required: No

**OrganizationArn.N**

The Amazon Resource Name (ARN) of an organization. This parameter can be used only when the `Attribute` parameter is `launchPermission`.

Type: Array of strings

Required: No

**ProductCode.N**

Not supported.

Type: Array of strings

Required: No

**UserGroup.N**

The user groups. This parameter can be used only when the `Attribute` parameter is `launchPermission`.

Type: Array of strings

Required: No

**UserId.N**

The AWS account IDs. This parameter can be used only when the `Attribute` parameter is `launchPermission`.

Type: Array of strings

Required: No

**Value**

The value of the attribute being modified. This parameter can be used only when the `Attribute` parameter is `description` or `imdsSupport`.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example makes the AMI public (for example, so any AWS account can use it).

**Sample Request**

```
https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
```

```
&LaunchPermission.Add.1.Group=all
&AUTHPARAMS
```

### Sample Response

```
<ModifyImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ModifyImageAttributeResponse>
```

## Example 2

This example makes the AMI private (for example, so that only you as the owner can use it).

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&LaunchPermission.Remove.1.Group=all
&AUTHPARAMS
```

## Example 3

This example grants launch permission to the AWS account with ID 111122223333.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&LaunchPermission.Add.1.UserId=111122223333
&AUTHPARAMS
```

## Example 4

This example adds the `774F4FF8` product code to the `ami-61a54008` AMI.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
```

```
&ProductCode.1=774F4FF8
&AUTHPARAMS
```

### Example 5

This example changes the description of the AMI to `New Description`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&Description.Value=New Description
&AUTHPARAMS
```

### Example 6

This example sets the AMI to IMDSv2 only. Instances created from this AMI will require that IMDSv2 is used when requesting instance metadata.

Note that after you set the value to `v2.0`, you can't undo it.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyImageAttribute
&ImageId=ami-61a54008
&ImdsSupport.Value=v2.0
&AUTHPARAMS
```

# ModifyInstanceAttribute

Modifies the specified attribute of the specified instance. You can specify only one attribute at a time.

**Note:** Using this action to change the security groups associated with an elastic network interface (ENI) attached to an instance can result in an error if the instance has more than one ENI. To change the security groups associated with an ENI attached to an instance that has multiple ENIs, we recommend that you use the ModifyNetworkInterfaceAttribute action.

To modify some attributes, the instance must be stopped. For more information, see Modify a stopped instance in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Attribute**

The name of the attribute to modify.

> **Note**
>
> When changing the instance type: If the original instance type is configured for configurable bandwidth, and the desired instance type doesn't support configurable bandwidth, first set the existing bandwidth configuration to `default` using the ModifyInstanceNetworkPerformanceOptions operation.

Type: String

Valid Values: `disableApiTermination | instanceType | kernel | ramdisk | instanceInitiatedShutdownBehavior | blockDeviceMapping | userData | sourceDestCheck | groupSet | ebsOptimized | sriovNetSupport | enaSupport | nvmeSupport | disableApiStop | enclaveOptions`

Required: No

**BlockDeviceMapping.N**

Modifies the `DeleteOnTermination` attribute for volumes that are currently attached. The volume must be owned by the caller. If no value is specified for `DeleteOnTermination`, the default is `true` and the volume is deleted when the instance is terminated. You can't modify the `DeleteOnTermination` attribute for volumes that are attached to AWS-managed resources.

To add instance store volumes to an Amazon EBS-backed instance, you must add them when you launch the instance. For more information, see Update the block device mapping when launching an instance in the *Amazon EC2 User Guide*.

Type: Array of InstanceBlockDeviceMappingSpecification objects

Required: No

**DisableApiStop**

Indicates whether an instance is enabled for stop protection. For more information, see Enable stop protection for your instance.

Type: AttributeBooleanValue object

Required: No

**DisableApiTermination**

Enable or disable termination protection for the instance. If the value is `true`, you can't terminate the instance using the Amazon EC2 console, command line interface, or API. You can't enable termination protection for Spot Instances.

Type: AttributeBooleanValue object

Required: No

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EbsOptimized**

Specifies whether the instance is optimized for Amazon EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS Optimized instance.

Type: AttributeBooleanValue object

Required: No

**EnaSupport**

Set to `true` to enable enhanced networking with ENA for the instance.

This option is supported only for HVM instances. Specifying this option with a PV instance can make it unreachable.

Type: AttributeBooleanValue object

Required: No

**GroupId.N**

Replaces the security groups of the instance with the specified security groups. You must specify the ID of at least one security group, even if it's just the default security group for the VPC.

Type: Array of strings

Required: No

**InstanceId**

The ID of the instance.

Type: String

Required: Yes

**InstanceInitiatedShutdownBehavior**

Specifies whether an instance stops or terminates when you initiate shutdown from the instance (using the operating system command for system shutdown).

Type: AttributeValue object

Required: No

**InstanceType**

Changes the instance type to the specified value. For more information, see Instance types in the *Amazon EC2 User Guide*. If the instance type is not valid, the error returned is `InvalidInstanceAttributeValue`.

Type: AttributeValue object

Required: No

**Kernel**

Changes the instance's kernel to the specified value. We recommend that you use PV-GRUB instead of kernels and RAM disks. For more information, see PV-GRUB.

Type: AttributeValue object

Required: No

**Ramdisk**

Changes the instance's RAM disk to the specified value. We recommend that you use PV-GRUB instead of kernels and RAM disks. For more information, see PV-GRUB.

Type: AttributeValue object

Required: No

**SourceDestCheck**

Enable or disable source/destination checks, which ensure that the instance is either the source or the destination of any traffic that it receives. If the value is `true`, source/destination checks are enabled; otherwise, they are disabled. The default value is `true`. You must disable source/destination checks if the instance runs services such as network address translation, routing, or firewalls.

Type: AttributeBooleanValue object

Required: No

**SriovNetSupport**

Set to `simple` to enable enhanced networking with the Intel 82599 Virtual Function interface for the instance.

There is no way to disable enhanced networking with the Intel 82599 Virtual Function interface at this time.

This option is supported only for HVM instances. Specifying this option with a PV instance can make it unreachable.

Type: AttributeValue object

Required: No

**UserData**

Changes the instance's user data to the specified value. User data must be base64-encoded. Depending on the tool or SDK that you're using, the base64-encoding might be performed for you. For more information, see Work with instance user data.

Type: SecureBlobAttributeValue object

Required: No

**Value**

A new value for the attribute. Use only with the `kernel`, `ramdisk`, `userData`, `disableApiTermination`, or `instanceInitiatedShutdownBehavior` attribute.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example changes the `instanceType` attribute of the specified instance. The instance must be in the `stopped` state.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceAttribute
&InstanceId=i-1234567890abcdef0
&InstanceType.Value=m1.small
&AUTHPARAMS
```

### Example 2

This example changes the `enaSupport` attribute of the specified instance.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceAttribute
&InstanceId=i-1234567890abcdef0
&EnaSupport.Value=true
&AUTHPARAMS
```

### Example 3

This example changes the `ebsOptimized` attribute of the specified instance.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceAttribute
&InstanceId=i-1234567890abcdef0
&EbsOptimized.Value=true
&AUTHPARAMS
```

### Example 4

This example changes the `instanceInitiatedShutdownBehavior` attribute of the specified instance.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceAttribute
&InstanceId=i-1234567890abcdef0
&InstanceInitiatedShutdownBehavior.Value=terminate
&AUTHPARAMS
```

### Example 5

This example changes the `disableApiTermination` attribute of the specified instance.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceAttribute
&InstanceId=i-1234567890abcdef0
&DisableApiTermination.Value=true
&AUTHPARAMS
```

# ModifyInstanceCapacityReservationAttributes

Modifies the Capacity Reservation settings for a stopped instance. Use this action to configure an instance to target a specific Capacity Reservation, run in any open Capacity Reservation with matching attributes, run in On-Demand Instance capacity, or only run in a Capacity Reservation.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CapacityReservationSpecification**

Information about the Capacity Reservation targeting option.

Type: CapacityReservationSpecification object

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance to be modified.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyInstanceConnectEndpoint

Modifies the specified EC2 Instance Connect Endpoint.

For more information, see Modify an EC2 Instance Connect Endpoint in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceConnectEndpointId**

The ID of the EC2 Instance Connect Endpoint to modify.

Type: String

Required: Yes

**IpAddressType**

The new IP address type for the EC2 Instance Connect Endpoint.

> **Note**
>
> `PreserveClientIp` is only supported on IPv4 EC2 Instance Connect Endpoints. To use `PreserveClientIp`, the value for `IpAddressType` must be `ipv4`.

Type: String

Valid Values: `ipv4 | dualstack | ipv6`

Required: No

**PreserveClientIp**

Indicates whether the client IP address is preserved as the source when you connect to a resource. The following are the possible values.

- `true` - Use the IP address of the client. Your instance must have an IPv4 address.
- `false` - Use the IP address of the network interface.

Type: Boolean

Required: No

**SecurityGroupId.N**

Changes the security groups for the EC2 Instance Connect Endpoint. The new set of groups you specify replaces the current set. You must specify at least one group, even if it's just the default security group in the VPC. You must specify the ID of the security group, not the name.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 16 items.

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example: Modify an EC2 Instance Connect Endpoint

This example modifies all the parameters of an EC2 Instance Connect Endpoint in a single request.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceConnectEndpoint
&InstanceConnectEndpointId=eice-0123456789example
&SecurityGroupId.1=sg-0123456789example
&IpAddressType=dualstack
&PreserveClientIp=false
&AUTHPARAMS
```

#### Sample Response

```
<ModifyInstanceConnectEndpointResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <return>true</return>
</ModifyInstanceConnectEndpointResponse>
```

# ModifyInstanceCpuOptions

By default, all vCPUs for the instance type are active when you launch an instance. When you configure the number of active vCPUs for the instance, it can help you save on licensing costs and optimize performance. The base cost of the instance remains unchanged.

The number of active vCPUs equals the number of threads per CPU core multiplied by the number of cores. The instance must be in a `Stopped` state before you make changes.

> **Note**
>
> Some instance type options do not support this capability. For more information, see Supported CPU options in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CoreCount**

The number of CPU cores to activate for the specified instance.

Type: Integer

Required: No

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance to update.

Type: String

Required: Yes

**NestedVirtualization**

Indicates whether to enable or disable nested virtualization for the instance. When nested virtualization is enabled, Virtual Secure Mode (VSM) is automatically disabled for the instance.

Type: String

Valid Values: `enabled | disabled`

Required: No

**ThreadsPerCore**

The number of threads to run for each CPU core.

Type: Integer

Required: No

## Response Elements

The following elements are returned by the service.

**coreCount**

The number of CPU cores that are running for the specified instance after the update.

Type: Integer

**instanceId**

The ID of the instance that was updated.

Type: String

**nestedVirtualization**

Indicates whether nested virtualization has been enabled or disabled.

Type: String

Valid Values: `enabled | disabled`

**requestId**

The ID of the request.

Type: String

**threadsPerCore**

The number of threads that are running per CPU core for the specified instance after the update.

Type: Integer

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This request example modifies the number of active vCPUs for the specified instance in the specified Region to 4 CPU cores running 2 threads each. This example assumes that the instance was stopped prior to running the request.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceCpuOptions
&Region=us-east-1
&InstanceId=i-1234567890abcdef0
&CoreCount=4
&ThreadsPerCore=2
&AUTHPARAMS
```

#### Sample Response

```
<ModifyInstanceCpuOptionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
 <requestId>11111111-2222-3333-4444-5555EXAMPLE</requestId>
 <instanceId>i-1234567890abcdef0</instanceId>
 <coreCount/>4</coreCount/>
```

```
 <threadsPerCore/>2</coreCount/>
</ModifyInstanceCpuOptionsResponse>
```

## See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyInstanceCreditSpecification

Modifies the credit option for CPU usage on a running or stopped burstable performance instance. The credit options are `standard` and `unlimited`.

For more information, see Burstable performance instances in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring Idempotency.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceCreditSpecification.N**

Information about the credit option for CPU usage.

Type: Array of InstanceCreditSpecificationRequest objects

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**successfulInstanceCreditSpecificationSet**

Information about the instances whose credit option for CPU usage was successfully modified.

Type: Array of SuccessfulInstanceCreditSpecificationItem objects

**unsuccessfulInstanceCreditSpecificationSet**

Information about the instances whose credit option for CPU usage was not modified.

Type: Array of UnsuccessfulInstanceCreditSpecificationItem objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This request modifies the credit option for CPU usage of the specified instance in the specified Region to `unlimited`. Valid credit options are `standard` and `unlimited`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceCreditSpecification
&Region=us-east-1
&InstanceCreditSpecification.1.InstanceId=i-1234567890abcdef0
&InstanceCreditSpecification.1.CpuCredits=unlimited
&AUTHPARAMS
```

#### Sample Response

```
<ModifyInstanceCreditSpecificationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>11111111-2222-3333-4444-5555EXAMPLE</requestId>
```

```
    <unsuccessfulInstanceCreditSpecificationSet/>
    <successfulInstanceCreditSpecificationSet>
        <item>
            <instanceId>i-1234567890abcdef0</instanceId>
        </item>
    </successfulInstanceCreditSpecificationSet>
```

## See Also

- AWS SDK for Ruby V3

# ModifyInstanceEventStartTime

Modifies the start time for a scheduled Amazon EC2 instance event.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceEventId**

The ID of the event whose date and time you are modifying.

Type: String

Required: Yes

**InstanceId**

The ID of the instance with the scheduled event.

Type: String

Required: Yes

**NotBefore**

The new date and time when the event will take place.

Type: Timestamp

Required: Yes

## Response Elements

The following elements are returned by the service.

**event**

Information about the event.

Type: InstanceStatusEvent object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

The following example shows how to modify the event start time for the specified instance. The event ID is specified by the `InstanceEventId` parameter and the new date and time is specified by the `NotBefore` parameter.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceEventStartTime
&InstanceId=i-1234567890abcdef0
&InstanceEventId=instance-event-0abcdef1234567890
&NotBefore=2019-03-25T10:00:00.000
&AUTHPARAMS
```

## See Also

# ModifyInstanceEventWindow

Modifies the specified event window.

You can define either a set of time ranges or a cron expression when modifying the event window, but not both.

To modify the targets associated with the event window, use the AssociateInstanceEventWindow and DisassociateInstanceEventWindow API.

If AWS has already scheduled an event, modifying an event window won't change the time of the scheduled event.

For more information, see Define event windows for scheduled events in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CronExpression**

The cron expression of the event window, for example, `* 0-4,20-23 * * 1,5`.

Constraints:

- Only hour and day of the week values are supported.
- For day of the week values, you can specify either integers `0` through 6, or alternative single values `SUN` through `SAT`.
- The minute, month, and year must be specified by `*`.
- The hour value must be one or a multiple range, for example, `0-4` or `0-4,20-23`.
- Each hour range must be >= 2 hours, for example, `0-2` or `20-23`.
- The event window must be >= 4 hours. The combined total time ranges in the event window must be >= 4 hours.

For more information about cron expressions, see cron on the *Wikipedia website*.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceEventWindowId**

The ID of the event window.

Type: String

Required: Yes

**Name**

The name of the event window.

Type: String

Required: No

**TimeRange.N**

The time ranges of the event window.

Type: Array of InstanceEventWindowTimeRangeRequest objects

Required: No

## Response Elements

The following elements are returned by the service.

**instanceEventWindow**

Information about the event window.

Type: InstanceEventWindow object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyInstanceMaintenanceOptions

Modifies the recovery behavior of your instance to disable simplified automatic recovery or set the recovery behavior to default. The default configuration will not enable simplified automatic recovery for an unsupported instance type. For more information, see Simplified automatic recovery.

Modifies the reboot migration behavior during a user-initiated reboot of an instance that has a pending `system-reboot` event. For more information, see Enable or disable reboot migration.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AutoRecovery**

Disables the automatic recovery behavior of your instance or sets it to default.

Type: String

Valid Values: `disabled | default`

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance.

Type: String

Required: Yes

**RebootMigration**

Specifies whether to attempt reboot migration during a user-initiated reboot of an instance that has a scheduled `system-reboot` event:

- `default` - Amazon EC2 attempts to migrate the instance to new hardware (reboot migration). If successful, the `system-reboot` event is cleared. If unsuccessful, an in-place reboot occurs and the event remains scheduled.
- `disabled` - Amazon EC2 keeps the instance on the same hardware (in-place reboot). The `system-reboot` event remains scheduled.

This setting only applies to supported instances that have a scheduled reboot event. For more information, see Enable or disable reboot migration in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `disabled | default`

Required: No

## Response Elements

The following elements are returned by the service.

**autoRecovery**

Provides information on the current automatic recovery behavior of your instance.

Type: String

Valid Values: `disabled | default`

**instanceId**

The ID of the instance.

Type: String

**rebootMigration**

Specifies whether to attempt reboot migration during a user-initiated reboot of an instance that has a scheduled `system-reboot` event:

- `default` - Amazon EC2 attempts to migrate the instance to new hardware (reboot migration). If successful, the `system-reboot` event is cleared. If unsuccessful, an in-place reboot occurs and the event remains scheduled.
- `disabled` - Amazon EC2 keeps the instance on the same hardware (in-place reboot). The `system-reboot` event remains scheduled.

This setting only applies to supported instances that have a scheduled reboot event. For more information, see Enable or disable reboot migration in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `disabled | default`

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ModifyInstanceMetadataDefaults

Modifies the default instance metadata service (IMDS) settings at the account level in the specified AWS
Region.

> **Note**
>
> To remove a parameter's account-level default setting, specify `no-preference`. If an account-level setting is cleared with `no-preference`, then the instance launch considers the other instance metadata settings. For more information, see Order of precedence for instance metadata options in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**HttpEndpoint**

Enables or disables the IMDS endpoint on an instance. When disabled, the instance metadata can't be accessed.

Type: String

Valid Values: `disabled | enabled | no-preference`

Required: No

**HttpPutResponseHopLimit**

The maximum number of hops that the metadata token can travel. To indicate no preference, specify `-1`.

Possible values: Integers from 1 to 64, and `-1` to indicate no preference

Type: Integer

Required: No

**HttpTokens**

Indicates whether IMDSv2 is required.

- `optional` – IMDSv2 is optional, which means that you can use either IMDSv2 or IMDSv1.
- `required` – IMDSv2 is required, which means that IMDSv1 is disabled, and you must use IMDSv2.

Type: String

Valid Values: `optional | required | no-preference`

Required: No

**HttpTokensEnforced**

Specifies whether to enforce the requirement of IMDSv2 on an instance at the time of launch. When enforcement is enabled, the instance can't launch unless IMDSv2 (`HttpTokens`) is set to `required`. For more information, see Enforce IMDSv2 at the account level in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `disabled | enabled | no-preference`

Required: No

**InstanceMetadataTags**

Enables or disables access to an instance's tags from the instance metadata. For more information, see View tags for your EC2 instances using instance metadata in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `disabled | enabled | no-preference`

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

If the request succeeds, the response returns `true`. If the request fails, no response is returned, and instead an error message is returned.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for Ruby V3

# ModifyInstanceMetadataOptions

Modify the instance metadata parameters on a running or stopped instance. When you modify the parameters on a stopped instance, they are applied when the instance is started. When you modify the parameters on a running instance, the API responds with a state of “pending”. After the parameter modifications are successfully applied to the instance, the state of the modifications changes from “pending” to “applied” in subsequent describe-instances API calls. For more information, see Instance metadata and user data in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**HttpEndpoint**

Enables or disables the HTTP metadata endpoint on your instances. If this parameter is not specified, the existing state is maintained.

If you specify a value of `disabled`, you cannot access your instance metadata.

Type: String

Valid Values: `disabled | enabled`

Required: No

**HttpProtocolIpv6**

Enables or disables the IPv6 endpoint for the instance metadata service. Applies only if you enabled the HTTP metadata endpoint.

Type: String

Valid Values: `disabled | enabled`

Required: No

**HttpPutResponseHopLimit**

The desired HTTP PUT response hop limit for instance metadata requests. The larger the number, the further instance metadata requests can travel. If no parameter is specified, the existing state is maintained.

Possible values: Integers from 1 to 64

Type: Integer

Required: No

**HttpTokens**

Indicates whether IMDSv2 is required.

- `optional` - IMDSv2 is optional. You can choose whether to send a session token in your instance metadata retrieval requests. If you retrieve IAM role credentials without a session token, you receive the IMDSv1 role credentials. If you retrieve IAM role credentials using a valid session token, you receive the IMDSv2 role credentials.
- `required` - IMDSv2 is required. You must send a session token in your instance metadata retrieval requests. With this option, retrieving the IAM role credentials always returns IMDSv2 credentials; IMDSv1 credentials are not available.

Default:

- If the value of `ImdsSupport` for the Amazon Machine Image (AMI) for your instance is `v2.0` and the account level default is set to `no-preference`, the default is `required`.
- If the value of `ImdsSupport` for the Amazon Machine Image (AMI) for your instance is `v2.0`, but the account level default is set to `V1 or V2`, the default is `optional`.

The default value can also be affected by other combinations of parameters. For more information, see Order of precedence for instance metadata options in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `optional | required`

Required: No

**InstanceId**

The ID of the instance.

Type: String

Required: Yes

**InstanceMetadataTags**

Set to `enabled` to allow access to instance tags from the instance metadata. Set to `disabled` to turn off access to instance tags from the instance metadata. For more information, see View tags for your EC2 instances using instance metadata.

Type: String

Valid Values: `disabled | enabled`

Required: No

## Response Elements

The following elements are returned by the service.

**instanceId**

The ID of the instance.

Type: String

**instanceMetadataOptions**

The metadata options for the instance.

Type: InstanceMetadataOptionsResponse object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1: Turn on token requirement

The following example disables access to the instance metadata unless a session token is used in the instance metadata request header. To turn on token requirement, specify `required` for `HttpTokens`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceMetadataOptions
&InstanceId=i-1234567890abcdef0
&HttpTokens=required
&AUTHPARAMS
```

#### Sample Response

```
<ModifyInstanceMetadataOptions xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <instanceId>i-1234567890abcdef0</instanceId>
    <MetadataOptions>
          <state>pending</state>
          <HttpTokens>required</HttpTokens>
          <HttpPutResponseHopLimit>1</HttpPutResponseHopLimit>
          <HttpEndpoint>enabled</HttpEndpoint>
    </MetadataOptions>
</ModifyInstanceMetadataOptions>
```

### Example 2: Turn off access to instance metadata

The following example disables access to the instance metadata by changing the HTTP endpoint state to disabled. To turn off access to instance metadata, specify `disabled` for `HttpEndpoint`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstanceMetadataOptions
&InstanceId=i-1234567890abcdef0
```

```
&HttpEndpoint=disabled
&AUTHPARAMS
```

### Sample Response

```
<ModifyInstanceMetadataOptions xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <instanceId>i-1234567890abcdef0</instanceId>
    <MetadataOptions>
          <state>pending</state>
          <HttpTokens>required</HttpTokens>
          <HttpPutResponseHopLimit>1</HttpPutResponseHopLimit>
          <HttpEndpoint>disabled</HttpEndpoint>
    </MetadataOptions>
</ModifyInstanceMetadataOptions>
```

# ModifyInstanceNetworkPerformanceOptions

Change the configuration of the network performance options for an existing instance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**BandwidthWeighting**

Specify the bandwidth weighting option to boost the associated type of baseline bandwidth, as follows:

default

This option uses the standard bandwidth configuration for your instance type.

vpc-1

This option boosts your networking baseline bandwidth and reduces your EBS baseline bandwidth.

ebs-1

This option boosts your EBS baseline bandwidth and reduces your networking baseline bandwidth.

Type: String

Valid Values: `default | vpc-1 | ebs-1`

Required: Yes

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance to update.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**bandwidthWeighting**

Contains the updated configuration for bandwidth weighting on the specified instance.

Type: String

Valid Values: `default | vpc-1 | ebs-1`

**instanceId**

The instance ID that was updated.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ModifyInstancePlacement

Modifies the placement attributes for a specified instance. You can do the following:

- Modify the affinity between an instance and a Dedicated Host. When affinity is set to `host` and the instance is not associated with a specific Dedicated Host, the next time the instance is started, it is automatically associated with the host on which it lands. If the instance is restarted or rebooted, this relationship persists.
- Change the Dedicated Host with which an instance is associated.
- Change the instance tenancy of an instance.
- Move an instance to or from a placement group.

At least one attribute for affinity, host ID, tenancy, or placement group name must be specified in the request. Affinity and tenancy can be modified in the same request.

To modify the host ID, tenancy, placement group, or partition for an instance, the instance must be in the `stopped` state.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Affinity**

The affinity setting for the instance. For more information, see Host affinity in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `default | host`

Required: No

**GroupId**

The Group Id of a placement group. You must specify the Placement Group **Group Id** to launch an instance in a shared placement group.

Type: String

Required: No

**GroupName**

The name of the placement group in which to place the instance. For spread placement groups, the instance must have a tenancy of `default`. For cluster and partition placement groups, the instance must have a tenancy of `default` or `dedicated`.

To remove an instance from a placement group, specify an empty string ("").

Type: String

Required: No

**HostId**

The ID of the Dedicated Host with which to associate the instance.

Type: String

Required: No

**HostResourceGroupArn**

The ARN of the host resource group in which to place the instance. The instance must have a tenancy of `host` to specify this parameter.

Type: String

Required: No

**InstanceId**

The ID of the instance that you are modifying.

Type: String

Required: Yes

**PartitionNumber**

The number of the partition in which to place the instance. Valid only if the placement group strategy is set to `partition`.

Type: Integer

Required: No

**Tenancy**

The tenancy for the instance.

> **Note**
>
> For T3 instances, you must launch the instance on a Dedicated Host to use a tenancy of `host`. You can't change the tenancy from `host` to `dedicated` or `default`. Attempting to make one of these unsupported tenancy changes results in an `InvalidRequest` error code.

Type: String

Valid Values: `default | dedicated | host`

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example 1

This example modifies the affinity of instance `i-0b33i09` so that it always has affinity with host `h-00548908djdsgfs`.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstancePlacement
&Affinity=host
&HostId=h-00548908djdsgfs
&InstanceId=i-0b33i09
&AUTHPARAMS
```

### Sample Response

```
<ModifyInstancePlacementResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <return>true</item>
</ModifyInstancePlacementResponse>
```

## Example 2

This example places instance `i-01234567812345678` in the placement group `MyPlacementGroup`.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyInstancePlacement
&InstanceId=i-01234567812345678
&GroupName=MyPlacementGroup
&AUTHPARAMS
```

# ModifyIpam

Modify the configurations of an IPAM.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddOperatingRegion.N**

Choose the operating Regions for the IPAM. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

For more information about operating Regions, see Create an IPAM in the *Amazon VPC IPAM User Guide*.

Type: Array of AddIpamOperatingRegion objects

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: No

**Description**

The description of the IPAM you want to modify.

Type: String

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EnablePrivateGua**

Enable this option to use your own GUA ranges as private IPv6 addresses. This option is disabled by default.

Type: Boolean

Required: No

**IpamId**

The ID of the IPAM you want to modify.

Type: String

Required: Yes

**MeteredAccount**

A metered account is an AWS account that is charged for active IP addresses managed in IPAM. For more information, see Enable cost distribution in the *Amazon VPC IPAM User Guide*.

Possible values:

- `ipam-owner` (default): The AWS account which owns the IPAM is charged for all active IP addresses managed in IPAM.
- `resource-owner`: The AWS account that owns the IP address is charged for the active IP address.

Type: String

Valid Values: `ipam-owner | resource-owner`

Required: No

**RemoveOperatingRegion.N**

The operating Regions to remove.

Type: Array of RemoveIpamOperatingRegion objects

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: No

**Tier**

IPAM is offered in a Free Tier and an Advanced Tier. For more information about the features available in each tier and the costs associated with the tiers, see Amazon VPC pricing > IPAM tab.

Type: String

Valid Values: `free | advanced`

Required: No

## Response Elements

The following elements are returned by the service.

**ipam**

The results of the modification.

Type: Ipam object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyIpamPolicyAllocationRules

Modifies the allocation rules in an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AllocationRule.N**

The new allocation rules to apply to the IPAM policy.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

Type: Array of IpamPolicyAllocationRuleRequest objects

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPolicyId**

The ID of the IPAM policy whose allocation rules you want to modify.

Type: String

Required: Yes

**Locale**

The locale for which to modify the allocation rules.

Type: String

Required: Yes

**ResourceType**

The resource type for which to modify the allocation rules.

The AWS service or resource type that can use IP addresses through IPAM policies. Supported services and resource types include:

- Elastic IP addresses

Type: String

Valid Values: `alb | eip | rds | rnat`

Required: Yes

## Response Elements

The following elements are returned by the service.

**ipamPolicyDocument**

The modified IPAM policy containing the updated allocation rules.

Type: IpamPolicyDocument object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyIpamPool

Modify the configurations of an IPAM pool.

For more information, see Modify a pool in the *Amazon VPC IPAM User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddAllocationResourceTag.N**

Add tag allocation rules to a pool. For more information about allocation rules, see Create a top-level pool in the *Amazon VPC IPAM User Guide*.

Type: Array of RequestIpamResourceTag objects

Required: No

**AllocationDefaultNetmaskLength**

The default netmask length for allocations added to this pool. If, for example, the CIDR assigned to this pool is 10.0.0.0/8 and you enter 16 here, new allocations will default to 10.0.0.0/16.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

**AllocationMaxNetmaskLength**

The maximum netmask length possible for CIDR allocations in this IPAM pool to be compliant. Possible netmask lengths for IPv4 addresses are 0 - 32. Possible netmask lengths for IPv6 addresses are 0 - 128.The maximum netmask length must be greater than the minimum netmask length.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

**AllocationMinNetmaskLength**

The minimum netmask length required for CIDR allocations in this IPAM pool to be compliant. Possible netmask lengths for IPv4 addresses are 0 - 32. Possible netmask lengths for IPv6 addresses are 0 - 128. The minimum netmask length must be less than the maximum netmask length.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

**AutoImport**

If true, IPAM will continuously look for resources within the CIDR range of this pool and automatically import them as allocations into your IPAM. The CIDRs that will be allocated for these resources must not already be allocated to other resources in order for the import to succeed. IPAM will import a CIDR regardless of its compliance with the pool's allocation rules, so a resource might be imported and subsequently marked as noncompliant. If IPAM discovers multiple CIDRs that overlap, IPAM will import the largest CIDR only. If IPAM discovers multiple CIDRs with matching CIDRs, IPAM will randomly import one of them only.

A locale must be set on the pool for this feature to work.

Type: Boolean

Required: No

**ClearAllocationDefaultNetmaskLength**

Clear the default netmask length allocation rule for this pool.

Type: Boolean

Required: No

**Description**

The description of the IPAM pool you want to modify.

Type: String

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPoolId**

The ID of the IPAM pool you want to modify.

Type: String

Required: Yes

**RemoveAllocationResourceTag.N**

Remove tag allocation rules from a pool.

Type: Array of RequestIpamResourceTag objects

Required: No

## Response Elements

The following elements are returned by the service.

**ipamPool**

The results of the modification.

Type: IpamPool object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyIpamPoolAllocation

Modifies the description of an IPAM pool allocation. For more information, see Modify an IPAM pool allocation in the *Amazon VPC IPAM User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Description**

The new description for the IPAM pool allocation. If you submit a `null` value, the description is removed from the allocation.

Type: String

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPoolAllocationId**

The ID of the IPAM pool allocation you want to modify.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**ipamPoolAllocation**

The modified IPAM pool allocation.

Type: IpamPoolAllocation object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ModifyIpamPrefixListResolver

Modifies an IPAM prefix list resolver. You can update the description and CIDR selection rules. Changes to rules will trigger re-evaluation and potential updates to associated prefix lists.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Description**

A new description for the IPAM prefix list resolver.

Type: String

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPrefixListResolverId**

The ID of the IPAM prefix list resolver to modify.

Type: String

Required: Yes

**Rule.N**

The updated CIDR selection rules for the resolver. These rules replace the existing rules entirely.

Type: Array of IpamPrefixListResolverRuleRequest objects

Required: No

## Response Elements

The following elements are returned by the service.

**ipamPrefixListResolver**

Information about the modified IPAM prefix list resolver.

Type: IpamPrefixListResolver object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++
- AWS SDK for Go v2
- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyIpamPrefixListResolverTarget

Modifies an IPAM prefix list resolver target. You can update version tracking settings and the desired version of the target prefix list.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

**DesiredVersion**

The desired version of the prefix list to target. This allows you to pin the target to a specific version.

Type: Long

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPrefixListResolverTargetId**

The ID of the IPAM prefix list resolver target to modify.

Type: String

Required: Yes

**TrackLatestVersion**

Indicates whether the resolver target should automatically track the latest version of the prefix list. When enabled, the target will always synchronize with the most current version.

Choose this for automatic updates when you want your prefix lists to stay current with infrastructure changes without manual intervention.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**ipamPrefixListResolverTarget**

Information about the modified IPAM prefix list resolver target.

Type: IpamPrefixListResolverTarget object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyIpamResourceCidr

Modify a resource CIDR. You can use this action to transfer resource CIDRs between scopes and ignore resource CIDRs that you do not want to manage. If set to false, the resource will not be tracked for overlap, it cannot be auto-imported into a pool, and it will be removed from any pool it has an allocation in.

For more information, see Move resource CIDRs between scopes and Change the monitoring state of resource CIDRs in the *Amazon VPC IPAM User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CurrentIpamScopeId**

The ID of the current scope that the resource CIDR is in.

Type: String

Required: Yes

**DestinationIpamScopeId**

The ID of the scope you want to transfer the resource CIDR to.

Type: String

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Monitored**

Determines if the resource is monitored by IPAM. If a resource is monitored, the resource is discovered by IPAM and you can view details about the resource's CIDR.

Type: Boolean

Required: Yes

**ResourceCidr**

The CIDR of the resource you want to modify.

Type: String

Required: Yes

**ResourceId**

The ID of the resource you want to modify.

Type: String

Required: Yes

**ResourceRegion**

The AWS Region of the resource you want to modify.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**ipamResourceCidr**

The CIDR of the resource.

Type: IpamResourceCidr object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyIpamResourceDiscovery

Modifies a resource discovery. A resource discovery is an IPAM component that enables IPAM to manage and monitor resources that belong to the owning account.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddOperatingRegion.N**

Add operating Regions to the resource discovery. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

Type: Array of AddIpamOperatingRegion objects

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: No

**AddOrganizationalUnitExclusion.N**

Add an Organizational Unit (OU) exclusion to your IPAM. If your IPAM is integrated with AWS Organizations and you add an organizational unit (OU) exclusion, IPAM will not manage the IP addresses in accounts in that OU exclusion. There is a limit on the number of exclusions you can create. For more information, see Quotas for your IPAM in the *Amazon VPC IPAM User Guide*.

> **Note**
>
> The resulting set of exclusions must not result in "overlap", meaning two or more OU exclusions must not exclude the same OU. For more information and examples, see the AWS CLI request process in Add or remove OU exclusions in the *Amazon VPC User Guide*.

Type: Array of AddIpamOrganizationalUnitExclusion objects

Array Members: Minimum number of 0 items. Maximum number of 10 items.

Required: No

**Description**

A resource discovery description.

Type: String

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamResourceDiscoveryId**

A resource discovery ID.

Type: String

Required: Yes

**RemoveOperatingRegion.N**

Remove operating Regions.

Type: Array of RemoveIpamOperatingRegion objects

Array Members: Minimum number of 0 items. Maximum number of 50 items.

Required: No

**RemoveOrganizationalUnitExclusion.N**

Remove an Organizational Unit (OU) exclusion to your IPAM. If your IPAM is integrated with AWS Organizations and you add an organizational unit (OU) exclusion, IPAM will not manage the IP addresses in accounts in that OU exclusion. There is a limit on the number of exclusions you can create. For more information, see Quotas for your IPAM in the *Amazon VPC IPAM User Guide*.

> **Note**
>
> The resulting set of exclusions must not result in "overlap", meaning two or more OU exclusions must not exclude the same OU. For more information and examples, see the AWS CLI request process in Add or remove OU exclusions in the *Amazon VPC User Guide*.

Type: Array of RemoveIpamOrganizationalUnitExclusion objects

Array Members: Minimum number of 0 items. Maximum number of 10 items.

Required: No

## Response Elements

The following elements are returned by the service.

**ipamResourceDiscovery**

A resource discovery.

Type: IpamResourceDiscovery object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4

- AWS SDK for Ruby V3

# ModifyIpamScope

Modify an IPAM scope.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Description**

The description of the scope you want to modify.

Type: String

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ExternalAuthorityConfiguration**

The configuration that links an Amazon VPC IPAM scope to an external authority system. It specifies the type of external system and the external resource identifier that identifies your account or instance in that system.

In IPAM, an external authority is a third-party IP address management system that provides CIDR blocks when you provision address space for top-level IPAM pools. This allows you to use your existing IP management system to control which address ranges are allocated to AWS while using Amazon VPC IPAM to manage subnets within those ranges.

Type: ExternalAuthorityConfiguration object

Required: No

**IpamScopeId**

The ID of the scope you want to modify.

Type: String

Required: Yes

**RemoveExternalAuthorityConfiguration**

Remove the external authority configuration. `true` to remove.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**ipamScope**

The results of the modification.

Type: IpamScope object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for .NET V4

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyLaunchTemplate

Modifies a launch template. You can specify which version of the launch template to set as the default version. When launching an instance, the default version applies when a launch template version is not specified.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

Unique, case-sensitive identifier you provide to ensure the idempotency of the request. If a client token isn't specified, a randomly generated token is used in the request to ensure idempotency.

For more information, see Ensuring idempotency.

Constraint: Maximum 128 ASCII characters.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**LaunchTemplateId**

The ID of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Required: No

**LaunchTemplateName**

The name of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

**SetDefaultVersion**

The version number of the launch template to set as the default version.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**launchTemplate**

Information about the launch template.

Type: LaunchTemplate object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example sets version 2 of launch template `lt-0a20c965061f64abc` as the default version.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyLaunchTemplate
&LaunchTemplateId=lt-0a20c965061f64abc
&SetDefaultVersion=2
&AUTHPARAMS
```

### Sample Response

```
<ModifyLaunchTemplateResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>5b348ca5-bb13-4106-baf9-14d02example</requestId>
    <launchTemplate>
        <createTime>1970-01-01T00:00:00.000Z</createTime>
        <createdBy>arn:aws:iam::123456789012:root</createdBy>
        <defaultVersionNumber>2</defaultVersionNumber>
        <latestVersionNumber>4</latestVersionNumber>
        <launchTemplateId>lt-0a20c965061f64abc</launchTemplateId>
        <launchTemplateName>MyLaunchTemplate</launchTemplateName>
    </launchTemplate>
</ModifyLaunchTemplateResponse>
```

- AWS SDK for Ruby V3

# ModifyLocalGatewayRoute

Modifies the specified local gateway route.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DestinationCidrBlock**

The CIDR block used for destination matches. The value that you provide must match the CIDR of an existing route in the table.

Type: String

Required: No

**DestinationPrefixListId**

The ID of the prefix list. Use a prefix list in place of `DestinationCidrBlock`. You cannot use `DestinationPrefixListId` and `DestinationCidrBlock` in the same request.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**LocalGatewayRouteTableId**

The ID of the local gateway route table.

Type: String

Required: Yes

**LocalGatewayVirtualInterfaceGroupId**

The ID of the virtual interface group.

Type: String

Required: No

**NetworkInterfaceId**

The ID of the network interface.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**route**

Information about the local gateway route table.

Type: LocalGatewayRoute object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyManagedPrefixList

Modifies the specified managed prefix list.

Adding or removing entries in a prefix list creates a new version of the prefix list. Changing the name of the prefix list does not affect the version.

If you specify a current version number that does not match the true current version number, the request fails.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddEntry.N**

One or more entries to add to the prefix list.

Type: Array of AddPrefixListEntry objects

Array Members: Minimum number of 0 items. Maximum number of 100 items.

Required: No

**CurrentVersion**

The current version of the prefix list.

Type: Long

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPrefixListResolverSyncEnabled**

Indicates whether synchronization with an IPAM prefix list resolver should be enabled for this managed prefix list. When enabled, the prefix list CIDRs are automatically updated based on the associated resolver's CIDR selection rules.

Type: Boolean

Required: No

**MaxEntries**

The maximum number of entries for the prefix list. You cannot modify the entries of a prefix list and modify the size of a prefix list at the same time.

If any of the resources that reference the prefix list cannot support the new maximum size, the modify operation fails. Check the state message for the IDs of the first ten resources that do not support the new maximum size.

Type: Integer

Required: No

**PrefixListId**

The ID of the prefix list.

Type: String

Required: Yes

**PrefixListName**

A name for the prefix list.

Type: String

Required: No

**RemoveEntry.N**

One or more entries to remove from the prefix list.

Type: Array of RemovePrefixListEntry objects

Array Members: Minimum number of 0 items. Maximum number of 100 items.

Required: No

## Response Elements

The following elements are returned by the service.

**prefixList**

Information about the prefix list.

Type: ManagedPrefixList object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example modifies the specified managed prefix list by adding another entry.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyManagedPrefixList
&PrefixListId=pl-0123123123123aabb
&CurrentVersion=1
&AddEntry.1.Cidr=10.1.0.0/16
&AddEntry.1.Description=Miami office
&AUTHPARAMS
```

#### Sample Response

```
<ModifyManagedPrefixListResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>602f3752-c348-4b14-81e2-example</requestId>
```

```
    <prefixList>
        <addressFamily>IPv4</addressFamily>
        <maxEntries>10</maxEntries>
        <ownerId>123456789012</ownerId>
        <prefixListArn>arn:aws:ec2:us-east-1:123456789012:prefix-list/
pl-0123123123123aabb</prefixListArn>
        <prefixListId>pl-0123123123123aabb</prefixListId>
        <prefixListName>tgw-attachments</prefixListName>
        <state>modify-in-progress</state>
        <version>1</version>
    </prefixList>
</ModifyManagedPrefixListResponse>
```

# ModifyManagedResourceVisibility

Modifies the managed resource visibility configuration for the account. Use this operation to control whether managed resources are hidden or visible by default. Visibility settings are account-wide and affect all IAM principals uniformly. Hidden resources remain fully operational and billable.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DefaultVisibility**

The default visibility setting for managed resources. Valid values: `hidden` | `visible`.

Type: String

Valid Values: `hidden | visible`

Required: Yes

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**visibility**

The updated managed resource visibility settings for the account.

Type: ManagedResourceVisibilitySettings object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyNetworkInterfaceAttribute

Modifies the specified network interface attribute. You can specify only one attribute at a time. You can use this action to attach and detach security groups from an existing EC2 instance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AssociatedSubnetId.N**

A list of subnet IDs to associate with the network interface.

Type: Array of strings

Required: No

**AssociatePublicIpAddress**

Indicates whether to assign a public IPv4 address to a network interface. This option can be enabled for any network interface but will only apply to the primary network interface (eth0).

Type: Boolean

Required: No

**Attachment**

Information about the interface attachment. If modifying the `delete on termination` attribute, you must specify the ID of the interface attachment.

Type: NetworkInterfaceAttachmentChanges object

Required: No

**ConnectionTrackingSpecification**

A connection tracking specification.

Type: ConnectionTrackingSpecificationRequest object

Required: No

**Description**

A description for the network interface.

Type: AttributeValue object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EnablePrimaryIpv6**

If you're modifying a network interface in a dual-stack or IPv6-only subnet, you have the option to assign a primary IPv6 IP address. A primary IPv6 address is an IPv6 GUA address associated with an ENI that you have enabled to use a primary IPv6 address. Use this option if the instance that this ENI will be attached to relies on its IPv6 address not changing. AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.

Type: Boolean

Required: No

**EnaSrdSpecification**

Updates the ENA Express configuration for the network interface that's attached to the instance.

Type: EnaSrdSpecification object

Required: No

**NetworkInterfaceId**

The ID of the network interface.

Type: String

Required: Yes

**SecurityGroupId.N**

Changes the security groups for the network interface. The new set of groups you specify replaces the current set. You must specify at least one group, even if it's just the default security group in the VPC. You must specify the ID of the security group, not the name.

Type: Array of strings

Required: No

**SourceDestCheck**

Enable or disable source/destination checks, which ensure that the instance is either the source or the destination of any traffic that it receives. If the value is `true`, source/destination checks are enabled; otherwise, they are disabled. The default value is `true`. You must disable source/destination checks if the instance runs services such as network address translation, routing, or firewalls.

Type: AttributeBooleanValue object

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example sets source/destination checking to `false` for the specified network interface.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyNetworkInterfaceAttribute
&NetworkInterfaceId=eni-ffda3197
&SourceDestCheck.Value=false
&AUTHPARAMS
```

#### Sample Response

```
<ModifyNetworkInterfaceAttributeResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>657a4623-5620-4232-b03b-427e852d71cf</requestId>
    <return>true</return>
</ModifyNetworkInterfaceAttributeResponse>
```

# ModifyPrivateDnsNameOptions

Modifies the options for instance hostnames for the specified instance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EnableResourceNameDnsAAAARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS AAAA records.

Type: Boolean

Required: No

**EnableResourceNameDnsARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS A records.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance.

Type: String

Required: Yes

**PrivateDnsHostnameType**

The type of hostname for EC2 instances. For IPv4 only subnets, an instance DNS name must be based on the instance IPv4 address. For IPv6 only subnets, an instance DNS name must be based on the instance ID. For dual-stack subnets, you can specify whether DNS names use the instance IPv4 address or the instance ID.

Type: String

Valid Values: `ip-name | resource-name`

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyPublicIpDnsNameOptions

Modify public hostname options for a network interface. For more information, see EC2 instance hostnames, DNS names, and domains in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**HostnameType**

The public hostname type. For more information, see EC2 instance hostnames, DNS names, and domains in the *Amazon EC2 User Guide*.

- `public-dual-stack-dns-name`: A dual-stack public hostname for a network interface. Requests from within the VPC resolve to both the private IPv4 address and the IPv6 Global Unicast Address of the network interface. Requests from the internet resolve to both the public IPv4 and the IPv6 GUA address of the network interface.
- `public-ipv4-dns-name`: An IPv4-enabled public hostname for a network interface. Requests from within the VPC resolve to the private primary IPv4 address of the network interface. Requests from the internet resolve to the public IPv4 address of the network interface.
- `public-ipv6-dns-name`: An IPv6-enabled public hostname for a network interface. Requests from within the VPC or from the internet resolve to the IPv6 GUA of the network interface.

Type: String

Valid Values: `public-dual-stack-dns-name | public-ipv4-dns-name | public-ipv6-dns-name`

Required: Yes

**NetworkInterfaceId**

A network interface ID.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**successful**

Whether or not the request was successful.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyReservedInstances

Modifies the configuration of your Reserved Instances, such as the Availability Zone, instance count, or instance type. The Reserved Instances to be modified must be identical, except for Availability Zone, network platform, and instance type.

For more information, see Modify Reserved Instances in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

A unique, case-sensitive token you provide to ensure idempotency of your modification request. For more information, see Ensuring Idempotency.

Type: String

Required: No

**ReservedInstancesConfigurationSetItemType.N**

The configuration settings for the Reserved Instances to modify.

Type: Array of ReservedInstancesConfiguration objects

Required: Yes

**ReservedInstancesId.N**

The IDs of the Reserved Instances to modify.

Type: Array of strings

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**reservedInstancesModificationId**

The ID for the modification.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example illustrates one usage of ModifyReservedInstances.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyReservedInstances
&ClientToken=myClientToken
&ReservedInstancesConfigurationSetItemType.1.AvailabilityZone=us-east-1a
&ReservedInstancesConfigurationSetItemType.1.InstanceCount=1
&ReservedInstancesConfigurationSetItemType.1.Platform=EC2-VPC
&ReservedInstancesConfigurationSetItemType.1.InstanceType=m1.small
&ReservedInstancesId.1=d16f7a91-4d0f-4f19-9d7f-a74d26b1ccfa
&AUTHPARAMS
```

#### Sample Response

```
<ModifyReservedInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
<requestId>bef729b6-0731-4489-8881-2258746ae163</requestId>
<reservedInstancesModificationId>rimod-3aae219d-3d63-47a9-a7e9-e764example</
reservedInstancesModificationId>
</ModifyReservedInstancesResponse>
```

# ModifyRouteServer

Modifies the configuration of an existing route server.

Amazon VPC Route Server simplifies routing for traffic between workloads that are deployed within a VPC and its internet gateways. With this feature, VPC Route Server dynamically updates VPC and internet gateway route tables with your preferred IPv4 or IPv6 routes to achieve routing fault tolerance for those workloads. This enables you to automatically reroute traffic within a VPC, which increases the manageability of VPC routing and interoperability with third-party workloads.

Route server supports the follow route table types:

- VPC route tables not associated with subnets
- Subnet route tables
- Internet gateway route tables

Route server does not support route tables associated with virtual private gateways. To propagate routes into a transit gateway route table, use Transit Gateway Connect.

For more information see Dynamic routing in your VPC with VPC Route Server in the *Amazon VPC User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PersistRoutes**

Specifies whether to persist routes after all BGP sessions are terminated.

- enable: Routes will be persisted in FIB and RIB after all BGP sessions are terminated.
- disable: Routes will not be persisted in FIB and RIB after all BGP sessions are terminated.
- reset: If a route server has persisted routes due to all BGP sessions having ended, reset will withdraw all routes and reset route server to an empty FIB and RIB.

Type: String

Valid Values: `enable | disable | reset`

Required: No

**PersistRoutesDuration**

The number of minutes a route server will wait after BGP is re-established to unpersist the routes in the FIB and RIB. Value must be in the range of 1-5. Required if PersistRoutes is `enabled`.

If you set the duration to 1 minute, then when your network appliance re-establishes BGP with route server, it has 1 minute to relearn it's adjacent network and advertise those routes to route server before route server resumes normal functionality. In most cases, 1 minute is probably sufficient. If, however, you have concerns that your BGP network may not be capable of fully re-establishing and re-learning everything in 1 minute, you can increase the duration up to 5 minutes.

Type: Long

Required: No

**RouteServerId**

The ID of the route server to modify.

Type: String

Required: Yes

**SnsNotificationsEnabled**

Specifies whether to enable SNS notifications for route server events. Enabling SNS notifications persists BGP status changes to an SNS topic provisioned by AWS.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**routeServer**

Information about the modified route server.

Type: RouteServer object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ModifySecurityGroupRules

Modifies the rules of a security group.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**GroupId**

The ID of the security group.

Type: String

Required: Yes

**SecurityGroupRule.N**

Information about the security group properties to update.

Type: Array of SecurityGroupRuleUpdate objects

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifySnapshotAttribute

Adds or removes permission settings for the specified snapshot. You may add or remove specified AWS account IDs from a snapshot's list of create volume permissions, but you cannot do both in a single operation. If you need to both add and remove account IDs for a snapshot, you must use multiple operations. You can make up to 500 modifications to a snapshot in a single operation.

Encrypted snapshots and snapshots with AWS Marketplace product codes cannot be made public. Snapshots encrypted with your default KMS key cannot be shared with other accounts.

For more information about modifying snapshot permissions, see Share a snapshot in the *Amazon EBS User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Attribute**

The snapshot attribute to modify. Only volume creation permissions can be modified.

Type: String

Valid Values: `productCodes | createVolumePermission`

Required: No

**CreateVolumePermission**

A JSON representation of the snapshot attribute modification.

Type: CreateVolumePermissionModifications object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**OperationType**

The type of operation to perform to the attribute.

Type: String

Valid Values: `add | remove`

Required: No

**SnapshotId**

The ID of the snapshot.

Type: String

Required: Yes

**UserGroup.N**

The group to modify for the snapshot.

Type: Array of strings

Required: No

**UserId.N**

The account ID to modify for the snapshot.

Type: Array of strings

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example makes the `snap-1234567890abcdef0` snapshot public, and gives the account with ID `111122223333` permission to create volumes from the snapshot.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifySnapshotAttribute
&SnapshotId=snap-1234567890abcdef0
&CreateVolumePermission.Add.1.UserId=111122223333
&CreateVolumePermission.Add.1.Group=all
&AUTHPARAMS
```

#### Sample Response

```
<ModifySnapshotAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</ModifySnapshotAttributeResponse>
```

### Example

This example makes the `snap-1234567890abcdef0` snapshot public, and removes the account with ID `111122223333` from the list of users with permission to create volumes from the snapshot.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifySnapshotAttribute
```

```
&SnapshotId=snap-1234567890abcdef0
&CreateVolumePermission.Remove.1.UserId=111122223333
&CreateVolumePermission.Add.1.Group=all
&AUTHPARAMS
```

### Sample Response

```
<ModifySnapshotAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</ModifySnapshotAttributeResponse>
```

# ModifySnapshotTier

Archives an Amazon EBS snapshot. When you archive a snapshot, it is converted to a full snapshot that includes all of the blocks of data that were written to the volume at the time the snapshot was created, and moved from the standard tier to the archive tier. For more information, see Archive Amazon EBS snapshots in the *Amazon EBS User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**SnapshotId**

The ID of the snapshot.

Type: String

Required: Yes

**StorageTier**

The name of the storage tier. You must specify `archive`.

Type: String

Valid Values: `archive`

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**snapshotId**

The ID of the snapshot.

Type: String

**tieringStartTime**

The date and time when the archive process was started.

Type: Timestamp

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ModifySpotFleetRequest

Modifies the specified Spot Fleet request.

You can only modify a Spot Fleet request of type `maintain`.

While the Spot Fleet request is being modified, it is in the `modifying` state.

To scale up your Spot Fleet, increase its target capacity. The Spot Fleet launches the additional Spot Instances according to the allocation strategy for the Spot Fleet request. If the allocation strategy is `lowestPrice`, the Spot Fleet launches instances using the Spot Instance pool with the lowest price. If the allocation strategy is `diversified`, the Spot Fleet distributes the instances across the Spot Instance pools. If the allocation strategy is `capacityOptimized`, Spot Fleet launches instances from Spot Instance pools with optimal capacity for the number of instances that are launching.

To scale down your Spot Fleet, decrease its target capacity. First, the Spot Fleet cancels any open requests that exceed the new target capacity. You can request that the Spot Fleet terminate Spot Instances until the size of the fleet no longer exceeds the new target capacity. If the allocation strategy is `lowestPrice`, the Spot Fleet terminates the instances with the highest price per unit. If the allocation strategy is `capacityOptimized`, the Spot Fleet terminates the instances in the Spot Instance pools that have the least available Spot Instance capacity. If the allocation strategy is `diversified`, the Spot Fleet terminates instances across the Spot Instance pools. Alternatively, you can request that the Spot Fleet keep the fleet at its current size, but not replace any Spot Instances that are interrupted or that you terminate manually.

If you are finished with your Spot Fleet for now, but will use it again later, you can set the target capacity to 0.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Context**

Reserved.

Type: String

Required: No

**ExcessCapacityTerminationPolicy**

Indicates whether running instances should be terminated if the target capacity of the Spot Fleet request is decreased below the current size of the Spot Fleet.

Supported only for fleets of type `maintain`.

Type: String

Valid Values: `noTermination | default`

Required: No

**LaunchTemplateConfig.N**

The launch template and overrides. You can only use this parameter if you specified a launch template (`LaunchTemplateConfigs`) in your Spot Fleet request. If you specified `LaunchSpecifications` in your Spot Fleet request, then omit this parameter.

Type: Array of LaunchTemplateConfig objects

Required: No

**OnDemandTargetCapacity**

The number of On-Demand Instances in the fleet.

Type: Integer

Required: No

**SpotFleetRequestId**

The ID of the Spot Fleet request.

Type: String

Required: Yes

**TargetCapacity**

The size of the fleet.

Type: Integer

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

If the request succeeds, the response returns `true`. If the request fails, no response is returned, and instead an error message is returned.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ModifySubnetAttribute

Modifies a subnet attribute. You can only modify one attribute at a time.

Use this action to modify subnets on AWS Outposts.

- To modify a subnet on an Outpost rack, set both `MapCustomerOwnedIpOnLaunch` and `CustomerOwnedIpv4Pool`. These two parameters act as a single attribute.
- To modify a subnet on an Outpost server, set either `EnableLniAtDeviceIndex` or `DisableLniAtDeviceIndex`.

For more information about AWS Outposts, see the following:

- Outpost servers
- Outpost racks

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AssignIpv6AddressOnCreation**

Specify `true` to indicate that network interfaces created in the specified subnet should be assigned an IPv6 address. This includes a network interface that's created when launching an instance into the subnet (the instance therefore receives an IPv6 address).

If you enable the IPv6 addressing feature for your subnet, your network interface or instance only receives an IPv6 address if it's created using version `2016-11-15` or later of the Amazon EC2 API.

Type: AttributeBooleanValue object

Required: No

**CustomerOwnedIpv4Pool**

The customer-owned IPv4 address pool associated with the subnet.

You must set this value when you specify `true` for `MapCustomerOwnedIpOnLaunch`.

Type: String

Required: No

**DisableLniAtDeviceIndex**

Specify `true` to indicate that local network interfaces at the current position should be disabled.

Type: AttributeBooleanValue object

Required: No

**EnableDns64**

Indicates whether DNS queries made to the Amazon-provided DNS Resolver in this subnet should return synthetic IPv6 addresses for IPv4-only destinations.

You must first configure a NAT gateway in a public subnet (separate from the subnet containing the IPv6-only workloads). For example, the subnet containing the NAT gateway should have a `0.0.0.0/0` route pointing to the internet gateway. For more information, see Configure DNS64 and NAT64 in the *Amazon VPC User Guide*.

Type: AttributeBooleanValue object

Required: No

**EnableLniAtDeviceIndex**

Indicates the device position for local network interfaces in this subnet. For example, 1 indicates local network interfaces in this subnet are the secondary network interface (eth1). A local network interface cannot be the primary network interface (eth0).

Type: Integer

Required: No

**EnableResourceNameDnsAAAARecordOnLaunch**

Indicates whether to respond to DNS queries for instance hostnames with DNS AAAA records.

Type: AttributeBooleanValue object

Required: No

**EnableResourceNameDnsARecordOnLaunch**

Indicates whether to respond to DNS queries for instance hostnames with DNS A records.

Type: AttributeBooleanValue object

Required: No

**MapCustomerOwnedIpOnLaunch**

Specify `true` to indicate that network interfaces attached to instances created in the specified subnet should be assigned a customer-owned IPv4 address.

When this value is `true`, you must specify the customer-owned IP pool using `CustomerOwnedIpv4Pool`.

Type: AttributeBooleanValue object

Required: No

**MapPublicIpOnLaunch**

Specify `true` to indicate that network interfaces attached to instances created in the specified subnet should be assigned a public IPv4 address.

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the *Public IPv4 Address* tab on the Amazon VPC pricing page.

Type: AttributeBooleanValue object

Required: No

**PrivateDnsHostnameTypeOnLaunch**

The type of hostname to assign to instances in the subnet at launch. For IPv4-only and dual-stack (IPv4 and IPv6) subnets, an instance DNS name can be based on the instance IPv4 address (ip-name) or the instance ID (resource-name). For IPv6 only subnets, an instance DNS name must be based on the instance ID (resource-name).

Type: String

Valid Values: `ip-name | resource-name`

Required: No

**SubnetId**

The ID of the subnet.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example modifies the attribute for `subnet-1a2b3c4d` to specify that all instances launched into this subnet are assigned a public IPv4 address.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=ModifySubnetAttribute
&SubnetId=subnet-1a2b3c4d
&MapPublicIpOnLaunch.Value=true
&AUTHPARAMS
```

### Sample Response

```
<ModifySubnetAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>c500a0bc-ad14-46c2-b9c5-e24aexample</requestId>
    <return>true</return>
</ModifySubnetAttributeResponse>
```

## Example 2

This example modifies the attribute for `subnet-1a2b3c4d` to specify that all network interfaces created in this subnet (and therefore all instances launched into this subnet with a new network interface) are assigned an IPv6 address.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifySubnetAttribute
&SubnetId=subnet-1a2b3c4d
&AssignIpv6AddressOnCreation.Value=true
&AUTHPARAMS
```

# ModifyTrafficMirrorFilterNetworkServices

Allows or restricts mirroring network services.

By default, Amazon DNS network services are not eligible for Traffic Mirror. Use `AddNetworkServices` to add network services to a Traffic Mirror filter. When a network service is added to the Traffic Mirror filter, all traffic related to that network service will be mirrored. When you no longer want to mirror network services, use `RemoveNetworkServices` to remove the network services from the Traffic Mirror filter.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddNetworkService.N**

The network service, for example Amazon DNS, that you want to mirror.

Type: Array of strings

Valid Values: `amazon-dns`

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**RemoveNetworkService.N**

The network service, for example Amazon DNS, that you no longer want to mirror.

Type: Array of strings

Valid Values: `amazon-dns`

Required: No

**TrafficMirrorFilterId**

The ID of the Traffic Mirror filter.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**trafficMirrorFilter**

The Traffic Mirror filter that the network service is associated with.

Type: TrafficMirrorFilter object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyTrafficMirrorFilterRule

Modifies the specified Traffic Mirror rule.

`DestinationCidrBlock` and `SourceCidrBlock` must both be an IPv4 range or an IPv6 range.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Description**

The description to assign to the Traffic Mirror rule.

Type: String

Required: No

**DestinationCidrBlock**

The destination CIDR block to assign to the Traffic Mirror rule.

Type: String

Required: No

**DestinationPortRange**

The destination ports that are associated with the Traffic Mirror rule.

Type: TrafficMirrorPortRangeRequest object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Protocol**

The protocol, for example TCP, to assign to the Traffic Mirror rule.

Type: Integer

Required: No

**RemoveField.N**

The properties that you want to remove from the Traffic Mirror filter rule.

When you remove a property from a Traffic Mirror filter rule, the property is set to the default.

Type: Array of strings

Valid Values: `destination-port-range | source-port-range | protocol | description`

Required: No

**RuleAction**

The action to assign to the rule.

Type: String

Valid Values: `accept | reject`

Required: No

**RuleNumber**

The number of the Traffic Mirror rule. This number must be unique for each Traffic Mirror rule in a given direction. The rules are processed in ascending order by rule number.

Type: Integer

Required: No

**SourceCidrBlock**

The source CIDR block to assign to the Traffic Mirror rule.

Type: String

Required: No

**SourcePortRange**

The port range to assign to the Traffic Mirror rule.

Type: TrafficMirrorPortRangeRequest object

Required: No

**TrafficDirection**

The type of traffic to assign to the rule.

Type: String

Valid Values: `ingress | egress`

Required: No

**TrafficMirrorFilterRuleId**

The ID of the Traffic Mirror rule.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**trafficMirrorFilterRule**

> **Note**
>
> Tags are not returned for ModifyTrafficMirrorFilterRule.

A Traffic Mirror rule.

Type: TrafficMirrorFilterRule object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyTrafficMirrorSession

Modifies a Traffic Mirror session.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Description**

The description to assign to the Traffic Mirror session.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PacketLength**

The number of bytes in each packet to mirror. These are bytes after the VXLAN header. To mirror a subset, set this to the length (in bytes) to mirror. For example, if you set this value to 100, then the first 100 bytes that meet the filter criteria are copied to the target. Do not specify this parameter when you want to mirror the entire packet.

For sessions with Network Load Balancer (NLB) traffic mirror targets, the default `PacketLength` will be set to 8500. Valid values are 1-8500. Setting a `PacketLength` greater than 8500 will result in an error response.

Type: Integer

Required: No

**RemoveField.N**

The properties that you want to remove from the Traffic Mirror session.

When you remove a property from a Traffic Mirror session, the property is set to the default.

Type: Array of strings

Valid Values: `packet-length | description | virtual-network-id`

Required: No

**SessionNumber**

The session number determines the order in which sessions are evaluated when an interface is used by multiple sessions. The first session with a matching filter is the one that mirrors the packets.

Valid values are 1-32766.

Type: Integer

Required: No

**TrafficMirrorFilterId**

The ID of the Traffic Mirror filter.

Type: String

Required: No

**TrafficMirrorSessionId**

The ID of the Traffic Mirror session.

Type: String

Required: Yes

**TrafficMirrorTargetId**

The Traffic Mirror target. The target must be in the same VPC as the source, or have a VPC peering connection with the source.

Type: String

Required: No

**VirtualNetworkId**

The virtual network ID of the Traffic Mirror session.

Type: Integer

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**trafficMirrorSession**

Information about the Traffic Mirror session.

Type: TrafficMirrorSession object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyTransitGateway

Modifies the specified transit gateway. When you modify a transit gateway, the modified options are applied to new transit gateway attachments only. Your existing transit gateway attachments are not modified.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Description**

The description for the transit gateway.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Options**

The options to modify.

Type: ModifyTransitGatewayOptions object

Required: No

**TransitGatewayId**

The ID of the transit gateway.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**transitGateway**

Information about the transit gateway.

Type: TransitGateway object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ModifyTransitGatewayMeteringPolicy

Modifies a transit gateway metering policy.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddMiddleboxAttachmentId.N**

The IDs of middlebox attachments to add to the metering policy.

Type: Array of strings

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**RemoveMiddleboxAttachmentId.N**

The IDs of middlebox attachments to remove from the metering policy.

Type: Array of strings

Required: No

**TransitGatewayMeteringPolicyId**

The ID of the transit gateway metering policy to modify.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**transitGatewayMeteringPolicy**

Information about the modified transit gateway metering policy.

Type: TransitGatewayMeteringPolicy object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for Ruby V3

# ModifyTransitGatewayPrefixListReference

Modifies a reference (route) to a prefix list in a specified transit gateway route table.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Blackhole**

Indicates whether to drop traffic that matches this route.

Type: Boolean

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PrefixListId**

The ID of the prefix list.

Type: String

Required: Yes

**TransitGatewayAttachmentId**

The ID of the attachment to which traffic is routed.

Type: String

Required: No

**TransitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**transitGatewayPrefixListReference**

Information about the prefix list reference.

Type: TransitGatewayPrefixListReference object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example modifies the prefix list reference in the specified route table by changing the attachment to which traffic is routed.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=ModifyTransitGatewayPrefixListReference
&TransitGatewayRouteTableId=tgw-rtb-0f98a0a5d09abcabc
&PrefixListId=pl-001122334455aabbc
&TransitGatewayAttachmentId=tgw-attach-11223344aabbcc112
```

```
&AUTHPARAMS
```

### Sample Response

```
<ModifyTransitGatewayPrefixListReferenceResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>bbd3e523-3e5b-4d3b-b010-example</requestId>
    <transitGatewayPrefixListReference>
        <blackhole>false</blackhole>
        <prefixListId>pl-001122334455aabbc</prefixListId>
        <prefixListOwnerId>123456789012</prefixListOwnerId>
        <state>modifying</state>
        <transitGatewayAttachment>
            <resourceId>tgw-012233aabbcc11223</resourceId>
            <resourceType>peering</resourceType>
            <transitGatewayAttachmentId>tgw-attach-11223344aabbcc112</
transitGatewayAttachmentId>
        </transitGatewayAttachment>
        <transitGatewayRouteTableId>tgw-rtb-0f98a0a5d09abcabc</
transitGatewayRouteTableId>
    </transitGatewayPrefixListReference>
</ModifyTransitGatewayPrefixListReferenceResponse>
```

# ModifyTransitGatewayVpcAttachment

Modifies the specified VPC attachment.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddSubnetIds.N**

The IDs of one or more subnets to add. You can specify at most one subnet per Availability Zone.

Type: Array of strings

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Options**

The new VPC attachment options.

Type: ModifyTransitGatewayVpcAttachmentRequestOptions object

Required: No

**RemoveSubnetIds.N**

The IDs of one or more subnets to remove.

Type: Array of strings

Required: No

**TransitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**transitGatewayVpcAttachment**

Information about the modified attachment.

Type: TransitGatewayVpcAttachment object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyVerifiedAccessEndpoint

Modifies the configuration of the specified AWS Verified Access endpoint.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CidrOptions**

The CIDR options.

Type: ModifyVerifiedAccessEndpointCidrOptions object

Required: No

**ClientToken**

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

**Description**

A description for the Verified Access endpoint.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**LoadBalancerOptions**

The load balancer details if creating the Verified Access endpoint as `load-balancer`type.

Type: ModifyVerifiedAccessEndpointLoadBalancerOptions object

Required: No

**NetworkInterfaceOptions**

The network interface options.

Type: ModifyVerifiedAccessEndpointEniOptions object

Required: No

**RdsOptions**

The RDS options.

Type: ModifyVerifiedAccessEndpointRdsOptions object

Required: No

**VerifiedAccessEndpointId**

The ID of the Verified Access endpoint.

Type: String

Required: Yes

**VerifiedAccessGroupId**

The ID of the Verified Access group.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**verifiedAccessEndpoint**

Details about the Verified Access endpoint.

Type: VerifiedAccessEndpoint object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyVerifiedAccessEndpointPolicy

Modifies the specified AWS Verified Access endpoint policy.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PolicyDocument**

The Verified Access policy document.

Type: String

Required: No

**PolicyEnabled**

The status of the Verified Access policy.

Type: Boolean

Required: No

**SseSpecification**

The options for server side encryption.

Type: VerifiedAccessSseSpecificationRequest object

Required: No

**VerifiedAccessEndpointId**

The ID of the Verified Access endpoint.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**policyDocument**

The Verified Access policy document.

Type: String

**policyEnabled**

The status of the Verified Access policy.

Type: Boolean

**requestId**

The ID of the request.

Type: String

**sseSpecification**

The options in use for server side encryption.

Type: VerifiedAccessSseSpecificationResponse object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ModifyVerifiedAccessGroup

Modifies the specified AWS Verified Access group configuration.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

**Description**

A description for the Verified Access group.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VerifiedAccessGroupId**

The ID of the Verified Access group.

Type: String

Required: Yes

**VerifiedAccessInstanceId**

The ID of the Verified Access instance.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**verifiedAccessGroup**

Details about the Verified Access group.

Type: VerifiedAccessGroup object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyVerifiedAccessGroupPolicy

Modifies the specified AWS Verified Access group policy.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PolicyDocument**

The Verified Access policy document.

Type: String

Required: No

**PolicyEnabled**

The status of the Verified Access policy.

Type: Boolean

Required: No

**SseSpecification**

The options for server side encryption.

Type: VerifiedAccessSseSpecificationRequest object

Required: No

**VerifiedAccessGroupId**

The ID of the Verified Access group.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**policyDocument**

The Verified Access policy document.

Type: String

**policyEnabled**

The status of the Verified Access policy.

Type: Boolean

**requestId**

The ID of the request.

Type: String

**sseSpecification**

The options in use for server side encryption.

Type: VerifiedAccessSseSpecificationResponse object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyVerifiedAccessInstance

Modifies the configuration of the specified AWS Verified Access instance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CidrEndpointsCustomSubDomain**

The custom subdomain.

Type: String

Required: No

**ClientToken**

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

**Description**

A description for the Verified Access instance.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VerifiedAccessInstanceId**

The ID of the Verified Access instance.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**verifiedAccessInstance**

Details about the Verified Access instance.

Type: VerifiedAccessInstance object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyVerifiedAccessInstanceLoggingConfiguration

Modifies the logging configuration for the specified AWS Verified Access instance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AccessLogs**

The configuration options for Verified Access instances.

Type: VerifiedAccessLogOptions object

Required: Yes

**ClientToken**

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VerifiedAccessInstanceId**

The ID of the Verified Access instance.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**loggingConfiguration**

The logging configuration for the Verified Access instance.

Type: VerifiedAccessInstanceLoggingConfiguration object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyVerifiedAccessTrustProvider

Modifies the configuration of the specified AWS Verified Access trust provider.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

A unique, case-sensitive token that you provide to ensure idempotency of your modification request. For more information, see Ensuring idempotency.

Type: String

Required: No

**Description**

A description for the Verified Access trust provider.

Type: String

Required: No

**DeviceOptions**

The options for a device-based trust provider. This parameter is required when the provider type is `device`.

Type: ModifyVerifiedAccessTrustProviderDeviceOptions object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**NativeApplicationOidcOptions**

The OpenID Connect (OIDC) options.

Type: ModifyVerifiedAccessNativeApplicationOidcOptions object

Required: No

**OidcOptions**

The options for an OpenID Connect-compatible user-identity trust provider.

Type: ModifyVerifiedAccessTrustProviderOidcOptions object

Required: No

**SseSpecification**

The options for server side encryption.

Type: VerifiedAccessSseSpecificationRequest object

Required: No

**VerifiedAccessTrustProviderId**

The ID of the Verified Access trust provider.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**verifiedAccessTrustProvider**

Details about the Verified Access trust provider.

Type: VerifiedAccessTrustProvider object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyVolume

You can modify several parameters of an existing EBS volume, including volume size, volume type, and IOPS capacity. If your EBS volume is attached to a current-generation EC2 instance type, you might be able to apply these changes without stopping the instance or detaching the volume from it. For more information about modifying EBS volumes, see Amazon EBS Elastic Volumes in the *Amazon EBS User Guide*.

When you complete a resize operation on your volume, you need to extend the volume's file-system size to take advantage of the new storage capacity. For more information, see Extend the file system.

For more information, see Monitor the progress of volume modifications in the *Amazon EBS User Guide*.

With previous-generation instance types, resizing an EBS volume might require detaching and reattaching the volume or stopping and restarting the instance.

After you initiate a volume modification, you must wait for that modification to reach the `completed` state before you can initiate another modification for the same volume. You can modify a volume up to four times within a rolling 24-hour period, as long as the volume is in the `in-use` or `available` state, and all previous modifications for that volume are `completed`. If you exceed this limit, you get an error message that indicates when you can perform your next modification.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Iops**

The target IOPS rate of the volume. This parameter is valid only for gp3, io1, and io2 volumes.

The following are the supported values for each volume type:

- gp3: 3,000 - 80,000 IOPS
- io1: 100 - 64,000 IOPS
- io2: 100 - 256,000 IOPS

> **Note**
>
> Instances built on the Nitro System can support up to 256,000 IOPS. Other instances can support up to 32,000 IOPS.

Default: The existing value is retained if you keep the same volume type. If you change the volume type to io1, io2, or gp3, the default is 3,000.

Type: Integer

Required: No

**MultiAttachEnabled**

Specifies whether to enable Amazon EBS Multi-Attach. If you enable Multi-Attach, you can attach the volume to up to 16 Nitro-based instances in the same Availability Zone. This parameter is supported with io1 and io2 volumes only. For more information, see Amazon EBS Multi-Attach in the *Amazon EBS User Guide*.

Type: Boolean

Required: No

**Size**

The target size of the volume, in GiB. The target volume size must be greater than or equal to the existing size of the volume.

The following are the supported volumes sizes for each volume type:

- gp2: 1 - 16,384 GiB
- gp3: 1 - 65,536 GiB

- `io1`: 4 - 16,384 GiB
- `io2`: 4 - 65,536 GiB
- `st1` and `sc1`: 125 - 16,384 GiB
- `standard`: 1 - 1024 GiB

Default: The existing size is retained.

Type: Integer

Required: No

**Throughput**

The target throughput of the volume, in MiB/s. This parameter is valid only for gp3 volumes. The maximum value is 2,000.

Default: The existing value is retained if the source and target volume type is gp3. Otherwise, the default value is 125.

Valid Range: Minimum value of 125. Maximum value of 2,000.

Type: Integer

Required: No

**VolumeId**

The ID of the volume.

Type: String

Required: Yes

**VolumeType**

The target EBS volume type of the volume. For more information, see Amazon EBS volume types in the *Amazon EBS User Guide*.

Default: The existing type is retained.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**volumeModification**

Information about the volume modification.

Type: VolumeModification object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Modify size, type, and IOPS provisioning of a volume

This example illustrates one usage of ModifyVolume.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVolume
&VolumeId=vol-1234567890EXAMPLE
&VolumeType=io1
&Iops=10000
&Size=200
&Version=2016-11-15
```

#### Sample Response

```
<ModifyVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>5jkdf074-37ed-4004-8671-a78ee82bf1cbEXAMPLE</requestId>
```

```
    <volumeModification>
        <targetIops>10000</targetIops>
        <originalIops>300</originalIops>
        <modificationState>modifying</modificationState>
        <targetSize>200</targetSize>
        <targetVolumeType>io1</targetVolumeType>
        <targetMultiAttachEnabled>false</targetMultiAttachEnabled>
        <volumeId>vol-1234567890EXAMPLE</volumeId>
        <progress>0</progress>
        <startTime>2017-01-19T23:58:04.922Z</startTime>
        <originalSize>100</originalSize>
        <originalVolumeType>gp2</originalVolumeType>
        <originalMultiAttachEnabled>false</originalMultiAttachEnabled>
    </volumeModification>
</ModifyVolumeResponse>
```

### Modify Multi-Attach support

This example illustrates one usage of ModifyVolume.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVolume
&VolumeId=vol-1234567890EXAMPLE
&MultiAttachEnabled=true
&Version=2016-11-15
```

#### Sample Response

```
<ModifyVolumeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>5jkdf074-37ed-4004-8671-a78ee82bf1cbEXAMPLE</requestId>
    <volumeModification>
        <originalMultiAttachEnabled>false</originalMultiAttachEnabled>
        <targetMultiAttachEnabled>true</targetMultiAttachEnabled>
    </volumeModification>
</ModifyVolumeResponse>
```

# ModifyVolumeAttribute

Modifies a volume attribute.

By default, all I/O operations for the volume are suspended when the data on the volume is determined to be potentially inconsistent, to prevent undetectable, latent data corruption. The I/O access to the volume can be resumed by first enabling I/O access and then checking the data consistency on your volume.

You can change the default behavior to resume I/O operations. We recommend that you change this only for boot volumes or for volumes that are stateless or disposable.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AutoEnableIO**

Indicates whether the volume should be auto-enabled for I/O operations.

Type: AttributeBooleanValue object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VolumeId**

The ID of the volume.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example modifies the attribute of the volume vol-1234567890abcdef0.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVolumeAttribute
&VolumeId=vol-1234567890abcdef0
&AutoEnableIO.Value=true
&AUTHPARAMS
```

#### Sample Response

```
<ModifyVolumeAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>5jkdf074-37ed-4004-8671-a78ee82bf1cbEXAMPLE</requestId>
   <return>true</return>
</ModifyVolumeAttributeResponse>
```

# ModifyVpcAttribute

Modifies the specified attribute of the specified VPC.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**EnableDnsHostnames**

Indicates whether the instances launched in the VPC get DNS hostnames. If enabled, instances in the VPC get DNS hostnames; otherwise, they do not.

You cannot modify the DNS resolution and DNS hostnames attributes in the same request. Use separate requests for each attribute. You can only enable DNS hostnames if you've enabled DNS support.

Type: AttributeBooleanValue object

Required: No

**EnableDnsSupport**

Indicates whether the DNS resolution is supported for the VPC. If enabled, queries to the Amazon provided DNS server at the 169.254.169.253 IP address, or the reserved IP address at the base of the VPC network range "plus two" succeed. If disabled, the Amazon provided DNS service in the VPC that resolves public DNS hostnames to IP addresses is not enabled.

You cannot modify the DNS resolution and DNS hostnames attributes in the same request. Use separate requests for each attribute.

Type: AttributeBooleanValue object

Required: No

**EnableNetworkAddressUsageMetrics**

Indicates whether Network Address Usage metrics are enabled for your VPC.

Type: AttributeBooleanValue object

Required: No

**VpcId**

The ID of the VPC.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example disables support for DNS hostnames in the specified VPC.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVpcAttribute
&VpcId=vpc-1a2b3c4d
&EnableDnsHostnames.Value=false
&AUTHPARAMS
```

### Sample Response

```
<ModifyVpcAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d742de94-5f3e-4c3d-b6d4-440cexample</requestId>
    <return>true</return>
</ModifyVpcAttributeResponse>
```

# ModifyVpcBlockPublicAccessExclusion

Modify VPC Block Public Access (BPA) exclusions. A VPC BPA exclusion is a mode that can be applied to a single VPC or subnet that exempts it from the account's BPA mode and will allow bidirectional or egress-only access. You can create BPA exclusions for VPCs and subnets even when BPA is not enabled on the account to ensure that there is no traffic disruption to the exclusions when VPC BPA is turned on.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ExclusionId**

The ID of an exclusion.

Type: String

Required: Yes

**InternetGatewayExclusionMode**

The exclusion mode for internet gateway traffic.

- `allow-bidirectional`: Allow all internet traffic to and from the excluded VPCs and subnets.
- `allow-egress`: Allow outbound internet traffic from the excluded VPCs and subnets. Block inbound internet traffic to the excluded VPCs and subnets. Only applies when VPC Block Public Access is set to Bidirectional.

Type: String

Valid Values: `allow-bidirectional | allow-egress`

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**vpcBlockPublicAccessExclusion**

Details related to the exclusion.

Type: VpcBlockPublicAccessExclusion object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ModifyVpcBlockPublicAccessOptions

Modify VPC Block Public Access (BPA) options. VPC Block Public Access (BPA) enables you to block resources in VPCs and subnets that you own in a Region from reaching or being reached from the internet through internet gateways and egress-only internet gateways. To learn more about VPC BPA, see Block public access to VPCs and subnets in the *Amazon VPC User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InternetGatewayBlockMode**

The mode of VPC BPA.

- `off`: VPC BPA is not enabled and traffic is allowed to and from internet gateways and egress-only internet gateways in this Region.
- `block-bidirectional`: Block all traffic to and from internet gateways and egress-only internet gateways in this Region (except for excluded VPCs and subnets).
- `block-ingress`: Block all internet traffic to the VPCs in this Region (except for VPCs or subnets which are excluded). Only traffic to and from NAT gateways and egress-only internet gateways is allowed because these gateways only allow outbound connections to be established.

Type: String

Valid Values: `off | block-bidirectional | block-ingress`

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**vpcBlockPublicAccessOptions**

Details related to the VPC Block Public Access (BPA) options.

Type: VpcBlockPublicAccessOptions object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ModifyVpcEncryptionControl

Modifies the encryption control configuration for a VPC. You can update the encryption mode and exclusion settings for various gateway types and peering connections.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EgressOnlyInternetGatewayExclusion**

Specifies whether to exclude egress-only internet gateway traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**ElasticFileSystemExclusion**

Specifies whether to exclude Elastic File System traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**InternetGatewayExclusion**

Specifies whether to exclude internet gateway traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**LambdaExclusion**

Specifies whether to exclude Lambda function traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**Mode**

The encryption mode for the VPC Encryption Control configuration.

Type: String

Valid Values: `monitor | enforce`

Required: No

**NatGatewayExclusion**

Specifies whether to exclude NAT gateway traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**VirtualPrivateGatewayExclusion**

Specifies whether to exclude virtual private gateway traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**VpcEncryptionControlId**

The ID of the VPC Encryption Control resource to modify.

Type: String

Required: Yes

**VpcLatticeExclusion**

Specifies whether to exclude VPC Lattice traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**VpcPeeringExclusion**

Specifies whether to exclude VPC peering connection traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**vpcEncryptionControl**

Information about the VPC Encryption Control configuration.

Type: VpcEncryptionControl object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyVpcEndpoint

Modifies attributes of a specified VPC endpoint. The attributes that you can modify depend on the type of VPC endpoint (interface, gateway, or Gateway Load Balancer). For more information, see the AWS PrivateLink Guide.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddRouteTableId.N**

(Gateway endpoint) The IDs of the route tables to associate with the endpoint.

Type: Array of strings

Required: No

**AddSecurityGroupId.N**

(Interface endpoint) The IDs of the security groups to associate with the endpoint network interfaces.

Type: Array of strings

Required: No

**AddSubnetId.N**

(Interface and Gateway Load Balancer endpoints) The IDs of the subnets in which to serve the endpoint. For a Gateway Load Balancer endpoint, you can specify only one subnet.

Type: Array of strings

Required: No

**DnsOptions**

The DNS options for the endpoint.

Type: DnsOptionsSpecification object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpAddressType**

The IP address type for the endpoint.

Type: String

Valid Values: `ipv4 | dualstack | ipv6`

Required: No

**PolicyDocument**

(Interface and gateway endpoints) A policy to attach to the endpoint that controls access to the service. The policy must be in valid JSON format.

Type: String

Required: No

**PrivateDnsEnabled**

(Interface endpoint) Indicates whether a private hosted zone is associated with the VPC.

Type: Boolean

Required: No

**RemoveRouteTableId.N**

(Gateway endpoint) The IDs of the route tables to disassociate from the endpoint.

Type: Array of strings

Required: No

**RemoveSecurityGroupId.N**

(Interface endpoint) The IDs of the security groups to disassociate from the endpoint network interfaces.

Type: Array of strings

Required: No

**RemoveSubnetId.N**

(Interface endpoint) The IDs of the subnets from which to remove the endpoint.

Type: Array of strings

Required: No

**ResetPolicy**

(Gateway endpoint) Specify `true` to reset the policy document to the default policy. The default policy allows full access to the service.

Type: Boolean

Required: No

**SubnetConfiguration.N**

The subnet configurations for the endpoint.

Type: Array of SubnetConfiguration objects

Required: No

**VpcEndpointId**

The ID of the endpoint.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example modifies gateway endpoint `vpce-1a2b3c4d` by associating route table `rtb-aaa222bb` with the endpoint, and resetting the policy document.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVpcEndpoint
&VpcEndpointId=vpce-1a2b3c4d
&ResetPolicy=true
&AddRouteTableId.1=rtb-aaa222bb
&AUTHPARAMS
```

#### Sample Response

```
<ModifyVpcEndpointResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <return>true</return>
    <requestId>125acea6-ba5c-4c6e-8e17-example</requestId>
</ModifyVpcEndpointResponse>
```

### Example 2

This example modifies interface endpoint `vpce-0fe5b17a0707d6fa5` by adding subnet `subnet-d6fcaa8d` to the endpoint.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVpcEndpoint
&VpcEndpointId=vpce-0fe5b17a0707d6fa5
&AddSubnetId.1=subnet-d6fcaa8db
&AUTHPARAMS
```

## See Also

- AWS SDK for Ruby V3

# ModifyVpcEndpointConnectionNotification

Modifies a connection notification for VPC endpoint or VPC endpoint service. You can change the SNS topic for the notification, or the events for which to be notified.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ConnectionEvents.N**

The events for the endpoint. Valid values are `Accept`, `Connect`, `Delete`, and `Reject`.

Type: Array of strings

Required: No

**ConnectionNotificationArn**

The ARN for the SNS topic for the notification.

Type: String

Required: No

**ConnectionNotificationId**

The ID of the notification.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

The following example modifies notification `vpce-nfn-abccb952bc8af7123` by modifying the endpoint events and the SNS topic ARN.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVpcEndpointConnectionNotification
&ConnectionNotificationId=vpce-nfn-abccb952bc8af7123
&ConnectionNotificationArn=arn:aws:sns:us-east-1:123456789012:mytopic
&ConnectionEvents.1=Accept
&ConnectionEvents.2=Reject
&AUTHPARAMS
```

#### Sample Response

```
<ModifyVpcEndpointConnectionNotificationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>08d80840-f750-42db-a6f8-2cd32example</requestId>
```

```
    <return>true</return>
</ModifyVpcEndpointConnectionNotificationResponse>
```

- AWS SDK for Ruby V3

# ModifyVpcEndpointServiceConfiguration

Modifies the attributes of the specified VPC endpoint service configuration.

If you set or modify the private DNS name, you must prove that you own the private DNS domain name.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AcceptanceRequired**

Indicates whether requests to create an endpoint to the service must be accepted.

Type: Boolean

Required: No

**AddGatewayLoadBalancerArn.N**

The Amazon Resource Names (ARNs) of Gateway Load Balancers to add to the service configuration.

Type: Array of strings

Required: No

**AddNetworkLoadBalancerArn.N**

The Amazon Resource Names (ARNs) of Network Load Balancers to add to the service configuration.

Type: Array of strings

Required: No

**AddSupportedIpAddressType.N**

The IP address types to add to the service configuration.

Type: Array of strings

Required: No

**AddSupportedRegion.N**

The supported Regions to add to the service configuration.

Type: Array of strings

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PrivateDnsName**

(Interface endpoint configuration) The private DNS name to assign to the endpoint service.

Type: String

Required: No

**RemoveGatewayLoadBalancerArn.N**

The Amazon Resource Names (ARNs) of Gateway Load Balancers to remove from the service configuration.

Type: Array of strings

Required: No

**RemoveNetworkLoadBalancerArn.N**

The Amazon Resource Names (ARNs) of Network Load Balancers to remove from the service configuration.

Type: Array of strings

Required: No

**RemovePrivateDnsName**

(Interface endpoint configuration) Removes the private DNS name of the endpoint service.

Type: Boolean

Required: No

**RemoveSupportedIpAddressType.N**

The IP address types to remove from the service configuration.

Type: Array of strings

Required: No

**RemoveSupportedRegion.N**

The supported Regions to remove from the service configuration.

Type: Array of strings

Required: No

**ServiceId**

The ID of the service.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example modifies service configuration `vpce-svc-03d5ebb7d9579a2b3` to specify that acceptance is required for interface VPC endpoint connection requests to the service, and to assign a private DNS name to the endpoint service.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVpcEndpointServiceConfiguration
&ServiceId=vpce-svc-03d5ebb7d9579a2b3
&AcceptanceRequired=true
&PrivateDnsName=myexampleservice.com
&AUTHPARAMS
```

#### Sample Response

```
<ModifyVpcEndpointServiceConfigurationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>08d80840-f750-42db-a6f8-2cd32example</requestId>
    <return>true</return>
</ModifyVpcEndpointServiceConfigurationResponse>
```

# ModifyVpcEndpointServicePayerResponsibility

Modifies the payer responsibility for your VPC endpoint service.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PayerResponsibility**

The entity that is responsible for the endpoint costs. The default is the endpoint owner. If you set the payer responsibility to the service owner, you cannot set it back to the endpoint owner.

Type: String

Valid Values: `ServiceOwner`

Required: Yes

**ServiceId**

The ID of the service.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyVpcEndpointServicePermissions

Modifies the permissions for your VPC endpoint service. You can add or remove permissions for service consumers (AWS accounts, users, and IAM roles) to connect to your endpoint service. Principal ARNs with path components aren't supported.

If you grant permissions to all principals, the service is public. Any users who know the name of a public service can send a request to attach an endpoint. If the service does not require manual approval, attachments are automatically approved.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AddAllowedPrincipals.N**

The Amazon Resource Names (ARN) of the principals. Permissions are granted to the principals in this list. To grant permissions to all principals, specify an asterisk (*).

Type: Array of strings

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**RemoveAllowedPrincipals.N**

The Amazon Resource Names (ARN) of the principals. Permissions are revoked for principals in this list.

Type: Array of strings

Required: No

**ServiceId**

The ID of the service.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**addedPrincipalSet**

Information about the added principals.

Type: Array of AddedPrincipal objects

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example permits all principals in AWS account `123456789012` to connect to your endpoint service `vpce-svc-03d5ebb7d9579a2b3`.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVpcEndpointServicePermissions
&ServiceId=vpce-svc-03d5ebb7d9579a2b3
&AddAllowedPrincipals.1=arn:aws:iam::123456789012:root
&AUTHPARAMS
```

### Sample Response

```
<ModifyVpcEndpointServicePermissionsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>08d80840-f750-42db-a6f8-2cd32example</requestId>
    <return>true</return>
</ModifyVpcEndpointServicePermissionsResponse>
```

## See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyVpcPeeringConnectionOptions

Modifies the VPC peering connection options on one side of a VPC peering connection.

If the peered VPCs are in the same AWS account, you can enable DNS resolution for queries from the local VPC. This ensures that queries from the local VPC resolve to private IP addresses in the peer VPC. This option is not available if the peered VPCs are in different AWS accounts or different Regions. For peered VPCs in different AWS accounts, each AWS account owner must initiate a separate request to modify the peering connection options. For inter-region peering connections, you must use the Region for the requester VPC to modify the requester VPC peering options and the Region for the accepter VPC to modify the accepter VPC peering options. To verify which VPCs are the accepter and the requester for a VPC peering connection, use the DescribeVpcPeeringConnections command.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AccepterPeeringConnectionOptions**

The VPC peering connection options for the accepter VPC.

Type: PeeringConnectionOptionsRequest object

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**RequesterPeeringConnectionOptions**

The VPC peering connection options for the requester VPC.

Type: PeeringConnectionOptionsRequest object

Required: No

**VpcPeeringConnectionId**

The ID of the VPC peering connection.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**accepterPeeringConnectionOptions**

Information about the VPC peering connection options for the accepter VPC.

Type: PeeringConnectionOptions object

**requesterPeeringConnectionOptions**

Information about the VPC peering connection options for the requester VPC.

Type: PeeringConnectionOptions object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

In this example, you want the public DNS hostnames of your instances in your VPC to resolve to private IP addresses when queried from instances in the peer VPC. You were the accepter of the VPC peering connection, therefore you modify the accepter VPC peering connection options.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVpcPeeringConnectionOptions
&VpcPeeringConnectionId=pcx-1a2b3c4d
&AccepterPeeringConnectionOptions.AllowDnsResolutionFromRemoteVpc=true
&AUTHPARAMS
```

### Sample Response

```
<ModifyVpcPeeringConnectionOptionsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>f5131846-7920-4359-b565-example</requestId>
  <accepterPeeringConnectionOptions>
    <allowDnsResolutionFromRemoteVpc>true</allowDnsResolutionFromRemoteVpc>
  </accepterPeeringConnectionOptions>
</ModifyVpcPeeringConnectionOptionsResponse>
```

# ModifyVpcTenancy

Modifies the instance tenancy attribute of the specified VPC. You can change the instance tenancy attribute of a VPC to `default` only. You cannot change the instance tenancy attribute to `dedicated`.

After you modify the tenancy of the VPC, any new instances that you launch into the VPC have a tenancy of `default`, unless you specify otherwise during launch. The tenancy of any existing instances in the VPC is not affected.

For more information, see Dedicated Instances in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceTenancy**

The instance tenancy attribute for the VPC.

Type: String

Valid Values: `default`

Required: Yes

**VpcId**

The ID of the VPC.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example modifies the tenancy of `vpc-1a2b3c4d` to `default`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ModifyVpcTenancy
&VpcId=vpc-1a2b3c4d
&InstanceTenancy=default
&AUTHPARAMS
```

#### Sample Response

```
<ModifyVpcTenancyResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <return>true</return>
    <requestId>125acea6-ba5c-4c6e-8e17-example</requestId>
```

```

# ModifyVpnConnection

Modifies the customer gateway or the target gateway of an AWS Site-to-Site VPN connection. To modify the target gateway, the following migration options are available:

- An existing virtual private gateway to a new virtual private gateway
- An existing virtual private gateway to a transit gateway
- An existing transit gateway to a new transit gateway
- An existing transit gateway to a virtual private gateway

Before you perform the migration to the new gateway, you must configure the new gateway. Use CreateVpnGateway to create a virtual private gateway, or CreateTransitGateway to create a transit gateway.

This step is required when you migrate from a virtual private gateway with static routes to a transit gateway.

You must delete the static routes before you migrate to the new gateway.

Keep a copy of the static route before you delete it. You will need to add back these routes to the transit gateway after the VPN connection migration is complete.

After you migrate to the new gateway, you might need to modify your VPC route table. Use CreateRoute and DeleteRoute to make the changes described in Update VPC route tables in the *AWS Site-to-Site VPN User Guide*.

When the new gateway is a transit gateway, modify the transit gateway route table to allow traffic between the VPC and the AWS Site-to-Site VPN connection. Use CreateTransitGatewayRoute to add the routes.

If you deleted VPN static routes, you must add the static routes to the transit gateway route table.

After you perform this operation, the VPN endpoint's IP addresses on the AWS side and the tunnel options remain intact. Your AWS Site-to-Site VPN connection will be temporarily unavailable for a brief period while we provision the new endpoints.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CustomerGatewayId**

The ID of the customer gateway at your end of the VPN connection.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**TransitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

**VpnConnectionId**

The ID of the VPN connection.

Type: String

Required: Yes

**VpnGatewayId**

The ID of the virtual private gateway at the AWS side of the VPN connection.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**vpnConnection**

Information about the VPN connection.

Type: VpnConnection object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ModifyVpnConnectionOptions

Modifies the connection options for your Site-to-Site VPN connection.

When you modify the VPN connection options, the VPN endpoint IP addresses on the AWS side do not change, and the tunnel options do not change. Your VPN connection will be temporarily unavailable for a brief period while the VPN connection is updated.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**LocalIpv4NetworkCidr**

The IPv4 CIDR on the customer gateway (on-premises) side of the VPN connection.

Default: `0.0.0.0/0`

Type: String

Required: No

**LocalIpv6NetworkCidr**

The IPv6 CIDR on the customer gateway (on-premises) side of the VPN connection.

Default: `::/0`

Type: String

Required: No

**RemoteIpv4NetworkCidr**

The IPv4 CIDR on the AWS side of the VPN connection.

Default: `0.0.0.0/0`

Type: String

Required: No

**RemoteIpv6NetworkCidr**

The IPv6 CIDR on the AWS side of the VPN connection.

Default: `::/0`

Type: String

Required: No

**TunnelBandwidth**

The desired bandwidth specification for the VPN connection. `standard` supports up to 1.25 Gbps per tunnel, while `large` supports up to 5 Gbps per tunnel. Large bandwidth is only available for VPN connections attached to a transit gateway or to Cloud WAN. The default value is `standard`.

Type: String

Valid Values: `standard | large`

Required: No

**VpnConnectionId**

The ID of the Site-to-Site VPN connection.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**vpnConnection**

Information about the VPN connection.

Type: VpnConnection object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ModifyVpnTunnelCertificate

Modifies the VPN tunnel endpoint certificate.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VpnConnectionId**

The ID of the AWS Site-to-Site VPN connection.

Type: String

Required: Yes

**VpnTunnelOutsideIpAddress**

The external IP address of the VPN tunnel.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**vpnConnection**

Information about the VPN connection.

Type: VpnConnection object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ModifyVpnTunnelOptions

Modifies the options for a VPN tunnel in an AWS Site-to-Site VPN connection. You can modify multiple options for a tunnel in a single request, but you can only modify one tunnel at a time. For more information, see Site-to-Site VPN tunnel options for your Site-to-Site VPN connection in the *AWS Site-to-Site VPN User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PreSharedKeyStorage**

Specifies the storage mode for the pre-shared key (PSK). Valid values are `Standard` (stored in Site-to-Site VPN service) or `SecretsManager` (stored in AWS Secrets Manager).

Type: String

Required: No

**SkipTunnelReplacement**

Choose whether or not to trigger immediate tunnel replacement. This is only applicable when turning on or off `EnableTunnelLifecycleControl`.

Valid values: `True` | `False`

Type: Boolean

Required: No

**TunnelOptions**

The tunnel options to modify.

Type: ModifyVpnTunnelOptionsSpecification object

Required: Yes

**VpnConnectionId**

The ID of the AWS Site-to-Site VPN connection.

Type: String

Required: Yes

**VpnTunnelOutsideIpAddress**

The external IP address of the VPN tunnel.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**vpnConnection**

Information about the VPN connection.

Type: VpnConnection object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# MonitorInstances

Enables detailed monitoring for a running instance. Otherwise, basic monitoring is enabled. For more information, see Monitor your instances using CloudWatch in the *Amazon EC2 User Guide*.

To disable detailed monitoring, see UnmonitorInstances.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId.N**

The IDs of the instances.

Type: Array of strings

Required: Yes

## Response Elements

The following elements are returned by the service.

**instancesSet**

The monitoring information.

Type: Array of InstanceMonitoring objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example enables detailed monitoring for the specified two instances.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=MonitorInstances
&InstanceId.1=i-1234567890abcdef0
&InstanceId.2=i-0598c7d356eba48d7
&AUTHPARAMS
```

#### Sample Response

```
<MonitorInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
    <instancesSet>
      <item>
        <instanceId>i-1234567890abcdef0</instanceId>
        <monitoring>
          <state>pending</state>
        </monitoring>
    </item>
    <item>
      <instanceId>i-0598c7d356eba48d7</instanceId>
        <monitoring>
          <state>pending</state>
        </monitoring>
      </item>
    </instancesSet>
</MonitorInstancesResponse>
```

# MoveAddressToVpc

> **Note**
>
> This action is deprecated.

Moves an Elastic IP address from the EC2-Classic platform to the EC2-VPC platform. The Elastic IP address must be allocated to your account for more than 24 hours, and it must not be associated with an instance. After the Elastic IP address is moved, it is no longer available for use in the EC2-Classic platform. You cannot move an Elastic IP address that was originally allocated for use in the EC2-VPC platform to the EC2-Classic platform.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PublicIp**

The Elastic IP address.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**allocationId**

The allocation ID for the Elastic IP address.

Type: String

**requestId**

The ID of the request.

Type: String

**status**

The status of the move of the IP address.

Type: String

Valid Values: `MoveInProgress | InVpc | InClassic`

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# MoveByoipCidrToIpam

Move a BYOIPv4 CIDR to IPAM from a public IPv4 pool.

If you already have a BYOIPv4 CIDR with AWS, you can move the CIDR to IPAM from a public IPv4 pool. You cannot move an IPv6 CIDR to IPAM. If you are bringing a new IP address to AWS for the first time, complete the steps in Tutorial: BYOIP address CIDRs to IPAM.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Cidr**

The BYOIP CIDR.

Type: String

Required: Yes

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPoolId**

The IPAM pool ID.

Type: String

Required: Yes

**IpamPoolOwner**

The AWS account ID of the owner of the IPAM pool.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**byoipCidr**

The BYOIP CIDR.

Type: ByoipCidr object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# MoveCapacityReservationInstances

Move available capacity from a source Capacity Reservation to a destination Capacity Reservation. The source Capacity Reservation and the destination Capacity Reservation must be `active`, owned by your AWS account, and share the following:

- Instance type
- Platform
- Availability Zone
- Tenancy
- Placement group
- Capacity Reservation end time - `At specific time` or `Manually`.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensure Idempotency.

Type: String

Required: No

**DestinationCapacityReservationId**

The ID of the Capacity Reservation that you want to move capacity into.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceCount**

The number of instances that you want to move from the source Capacity Reservation.

Type: Integer

Required: Yes

**SourceCapacityReservationId**

The ID of the Capacity Reservation from which you want to move capacity.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**destinationCapacityReservation**

Information about the destination Capacity Reservation.

Type: CapacityReservation object

**instanceCount**

The number of instances that were moved from the source Capacity Reservation to the destination Capacity Reservation.

Type: Integer

**requestId**

The ID of the request.

Type: String

**sourceCapacityReservation**

Information about the source Capacity Reservation.

Type: CapacityReservation object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ProvisionByoipCidr

Provisions an IPv4 or IPv6 address range for use with your AWS resources through bring your own IP addresses (BYOIP) and creates a corresponding address pool. After the address range is provisioned, it is ready to be advertised.

AWS verifies that you own the address range and are authorized to advertise it. You must ensure that the address range is registered to you and that you created an RPKI ROA to authorize Amazon ASNs 16509 and 14618 to advertise the address range. For more information, see Bring your own IP addresses (BYOIP) in the *Amazon EC2 User Guide*.

Provisioning an address range is an asynchronous operation, so the call returns immediately, but the address range is not ready to use until its status changes from `pending-provision` to `provisioned`. For more information, see Onboard your address range.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Cidr**

The public IPv4 or IPv6 address range, in CIDR notation. The most specific IPv4 prefix that you can specify is /24. The most specific IPv6 address range that you can bring is /48 for CIDRs that are publicly advertisable and /56 for CIDRs that are not publicly advertisable. The address range cannot overlap with another address range that you've brought to this or another Region.

Type: String

Required: Yes

**CidrAuthorizationContext**

A signed document that proves that you are authorized to bring the specified IP address range to Amazon using BYOIP.

Type: CidrAuthorizationContext object

Required: No

**Description**

A description for the address range and the address pool.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MultiRegion**

Reserved.

Type: Boolean

Required: No

**NetworkBorderGroup**

If you have Local Zones enabled, you can choose a network border group for Local Zones when you provision and advertise a BYOIPv4 CIDR. Choose the network border group carefully as the EIP and the AWS resource it is associated with must reside in the same network border group.

You can provision BYOIP address ranges to and advertise them in the following Local Zone network border groups:

- us-east-1-dfw-2
- us-west-2-lax-1
- us-west-2-phx-2

> **Note**
>
> You cannot provision or advertise BYOIPv6 address ranges in Local Zones at this time.

Type: String

Required: No

**PoolTagSpecification.N**

The tags to apply to the address pool.

Type: Array of TagSpecification objects

Required: No

**PubliclyAdvertisable**

(IPv6 only) Indicate whether the address range will be publicly advertised to the internet.

Default: true

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**byoipCidr**

Information about the address range.

Type: ByoipCidr object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# ProvisionIpamByoasn

Provisions your Autonomous System Number (ASN) for use in your AWS account. This action requires authorization context for Amazon to bring the ASN to an AWS account. For more information, see Tutorial: Bring your ASN to IPAM in the *Amazon VPC IPAM guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Asn**

A public 2-byte or 4-byte ASN.

Type: String

Required: Yes

**AsnAuthorizationContext**

An ASN authorization context.

Type: AsnAuthorizationContext object

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamId**

An IPAM ID.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**byoasn**

An ASN and BYOIP CIDR association.

Type: Byoasn object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ProvisionIpamPoolCidr

Provision a CIDR to an IPAM pool. You can use this action to provision new CIDRs to a top-level pool or to transfer a CIDR from a top-level pool to a pool within it.

For more information, see Provision CIDRs to pools in the *Amazon VPC IPAM User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Cidr**

The CIDR you want to assign to the IPAM pool. Either "NetmaskLength" or "Cidr" is required. This value will be null if you specify "NetmaskLength" and will be filled in during the provisioning process.

Type: String

Required: No

**CidrAuthorizationContext**

A signed document that proves that you are authorized to bring a specified IP address range to Amazon using BYOIP. This option only applies to IPv4 and IPv6 pools in the public scope.

Type: IpamCidrAuthorizationContext object

Required: No

**ClientToken**

A unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Type: String

Required: No

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamExternalResourceVerificationTokenId**

Verification token ID. This option only applies to IPv4 and IPv6 pools in the public scope.

Type: String

Required: No

**IpamPoolId**

The ID of the IPAM pool to which you want to assign a CIDR.

Type: String

Required: Yes

**NetmaskLength**

The netmask length of the CIDR you'd like to provision to a pool. Can be used for provisioning Amazon-provided IPv6 CIDRs to top-level pools and for provisioning CIDRs to pools with source pools. Cannot be used to provision BYOIP CIDRs to top-level pools. Either "NetmaskLength" or "Cidr" is required.

Type: Integer

Required: No

**VerificationMethod**

The method for verifying control of a public IP address range. Defaults to `remarks-x509` if not specified. This option only applies to IPv4 and IPv6 pools in the public scope.

Type: String

Valid Values: `remarks-x509 | dns-token`

Required: No

## Response Elements

The following elements are returned by the service.

**ipamPoolCidr**

Information about the provisioned CIDR.

Type: IpamPoolCidr object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

# ProvisionPublicIpv4PoolCidr

Provision a CIDR to a public IPv4 pool.

For more information about IPAM, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPoolId**

The ID of the IPAM pool you would like to use to allocate this CIDR.

Type: String

Required: Yes

**NetmaskLength**

The netmask length of the CIDR you would like to allocate to the public IPv4 pool. The least specific netmask length you can define is 24.

Type: Integer

Required: Yes

**NetworkBorderGroup**

The Availability Zone (AZ) or Local Zone (LZ) network border group that the resource that the IP address is assigned to is in. Defaults to an AZ network border group. For more information on available Local Zones, see Local Zone availability in the *Amazon EC2 User Guide*.

Type: String

Required: No

**PoolId**

The ID of the public IPv4 pool you would like to use for this CIDR.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**poolAddressRange**

Information about the address range of the public IPv4 pool.

Type: PublicIpv4PoolRange object

**poolId**

The ID of the pool that you want to provision the CIDR to.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# PurchaseCapacityBlock

Purchase the Capacity Block for use with your account. With Capacity Blocks you ensure GPU capacity is available for machine learning (ML) workloads. You must specify the ID of the Capacity Block offering you are purchasing.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CapacityBlockOfferingId**

The ID of the Capacity Block offering.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstancePlatform**

The type of operating system for which to reserve capacity.

Type: String

Valid Values: `Linux/UNIX | Red Hat Enterprise Linux | SUSE Linux | Windows | Windows with SQL Server | Windows with SQL Server Enterprise | Windows with SQL Server Standard | Windows with SQL Server Web | Linux with SQL Server Standard | Linux with SQL Server Web | Linux with SQL Server Enterprise | RHEL with SQL Server Standard | RHEL with SQL Server Enterprise | RHEL with SQL Server Web | RHEL with HA | RHEL with HA and`

`SQL Server Standard | RHEL with HA and SQL Server Enterprise | Ubuntu Pro`

Required: Yes

**TagSpecification.N**

The tags to apply to the Capacity Block during launch.

Type: Array of TagSpecification objects

Required: No

## Response Elements

The following elements are returned by the service.

**capacityBlockSet**

The Capacity Block.

Type: Array of CapacityBlock objects

**capacityReservation**

The Capacity Reservation.

Type: CapacityReservation object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# PurchaseCapacityBlockExtension

Purchase the Capacity Block extension for use with your account. You must specify the ID of the Capacity Block extension offering you are purchasing.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CapacityBlockExtensionOfferingId**

The ID of the Capacity Block extension offering to purchase.

Type: String

Required: Yes

**CapacityReservationId**

The ID of the Capacity reservation to be extended.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**capacityBlockExtensionSet**

The purchased Capacity Block extensions.

Type: Array of CapacityBlockExtension objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# PurchaseHostReservation

Purchase a reservation with configurations that match those of your Dedicated Host. You must have active Dedicated Hosts in your account before you purchase a reservation. This action results in the specified reservation being purchased and charged to your account.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

Required: No

**CurrencyCode**

The currency in which the `totalUpfrontPrice`, `LimitPrice`, and `totalHourlyPrice` amounts are specified. At this time, the only supported currency is USD.

Type: String

Valid Values: USD

Required: No

**HostIdSet.N**

The IDs of the Dedicated Hosts with which the reservation will be associated.

Type: Array of strings

Required: Yes

**LimitPrice**

The specified limit is checked against the total upfront cost of the reservation (calculated as the offering's upfront cost multiplied by the host count). If the total upfront cost is greater than the specified price limit, the request fails. This is used to ensure that the purchase does not exceed

the expected upfront cost of the purchase. At this time, the only supported currency is USD. For example, to indicate a limit price of USD 100, specify 100.00.

Type: String

Required: No

**OfferingId**

The ID of the offering.

Type: String

Required: Yes

**TagSpecification.N**

The tags to apply to the Dedicated Host Reservation during purchase.

Type: Array of TagSpecification objects

Required: No

## Response Elements

The following elements are returned by the service.

**clientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

**currencyCode**

The currency in which the `totalUpfrontPrice` and `totalHourlyPrice` amounts are specified. At this time, the only supported currency is USD.

Type: String

Valid Values: USD

**purchase**

Describes the details of the purchase.

Type: Array of Purchase objects

**requestId**

The ID of the request.

Type: String

**totalHourlyPrice**

The total hourly price of the reservation calculated per hour.

Type: String

**totalUpfrontPrice**

The total amount charged to your account when you purchase the reservation.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example uses the same configuration information from GetHostReservationPurchasePreview to make the purchase and associate the offering with the specified Dedicated Host.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=PurchaseHostReservation
&OfferingId=hro-0eb3541dght849c2d
&HostIdSet=h-0fgr9ddb0ecd0a1cd
&AUTHPARAMS
```

#### Sample Response

```
<PurchaseHostReservationResult xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-84c3-b40d-gtyk-a9983EXAMPLE</requestId>
        <purchase>
```

```
            <item>
                <duration>31536000</duration>
                <upfrontPrice>7453.000</upfrontPrice>
                <paymentOption>PartialUpfront</paymentOption>
                <instanceFamily>m4</instanceFamily>
                <hourlyPrice>0.850</hourlyPrice>
                <hostIdSet>
                    <item>h-0fgr9ddb0ecd0a1cd</item>
                </hostIdSet>
            </item>
        </purchase>
        <totalHourlyPrice>0.850<totalHourlyPrice>
        <totalUpfrontPrice>7453.000<totalUpfrontPrice>
</PurchaseHostReservationResult>
```

# PurchaseReservedInstancesOffering

Purchases a Reserved Instance for use with your account. With Reserved Instances, you pay a lower hourly rate compared to On-Demand instance pricing.

Use DescribeReservedInstancesOfferings to get a list of Reserved Instance offerings that match your specifications. After you've purchased a Reserved Instance, you can check for your new Reserved Instance with DescribeReservedInstances.

To queue a purchase for a future date and time, specify a purchase time. If you do not specify a purchase time, the default is the current time.

For more information, see Reserved Instances and Sell in the Reserved Instance Marketplace in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceCount**

The number of Reserved Instances to purchase.

Type: Integer

Required: Yes

**LimitPrice**

Specified for Reserved Instance Marketplace offerings to limit the total order and ensure that the Reserved Instances are not purchased at unexpected prices.

Type: ReservedInstanceLimitPrice object

Required: No

**PurchaseTime**

The time at which to purchase the Reserved Instance, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: No

**ReservedInstancesOfferingId**

The ID of the Reserved Instance offering to purchase.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**reservedInstancesId**

The IDs of the purchased Reserved Instances. If your purchase crosses into a discounted pricing tier, the final Reserved Instances IDs might change. For more information, see Crossing pricing tiers in the *Amazon EC2 User Guide*.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example 1

This example uses a limit price to limit the total purchase order of Standard Reserved Instances from the Reserved Instance Marketplace.

### Sample Request

```
https://ec2.amazonaws.com/?Action=PurchaseReservedInstancesOffering
&ReservedInstancesOfferingId=4b2293b4-5813-4cc8-9ce3-1957fEXAMPLE
&LimitPrice.Amount=200
&InstanceCount=2
&AUTHPARAMS
```

### Sample Response

```
<PurchaseReservedInstancesOfferingResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <reservedInstancesId>e5a2ff3b-7d14-494f-90af-0b5d0EXAMPLE</reservedInstancesId>
</PurchaseReservedInstancesOfferingResponse>
```

## Example 2

This example illustrates a purchase of a Reserved Instances offering.

### Sample Request

```
https://ec2.amazonaws.com/?Action=PurchaseReservedInstancesOffering
&ReservedInstancesOfferingId=4b2293b4-5813-4cc8-9ce3-1957fEXAMPLE
&InstanceCount=2
&AUTHPARAMS
```

### Sample Response

```
<PurchaseReservedInstancesOfferingResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <reservedInstancesId>e5a2ff3b-7d14-494f-90af-0b5d0EXAMPLE</reservedInstancesId>
```

```
</PurchaseReservedInstancesOfferingResponse>
```

# PurchaseScheduledInstances

> **Note**
>
> You can no longer purchase Scheduled Instances.

Purchases the Scheduled Instances with the specified schedule.

Scheduled Instances enable you to purchase Amazon EC2 compute capacity by the hour for a one-year term. Before you can purchase a Scheduled Instance, you must call DescribeScheduledInstanceAvailability to check for available schedules and obtain a purchase token. After you purchase a Scheduled Instance, you must call RunScheduledInstances during each scheduled time period.

After you purchase a Scheduled Instance, you can't cancel, modify, or resell your purchase.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

Unique, case-sensitive identifier that ensures the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PurchaseRequest.N**

The purchase requests.

Type: Array of PurchaseRequest objects

Array Members: Minimum number of 1 item.

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**scheduledInstanceSet**

Information about the Scheduled Instances.

Type: Array of ScheduledInstance objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# RebootInstances

Requests a reboot of the specified instances. This operation is asynchronous; it only queues a request to reboot the specified instances. The operation succeeds if the instances are valid and belong to you. Requests to reboot terminated instances are ignored.

If an instance does not cleanly shut down within a few minutes, Amazon EC2 performs a hard reboot.

For more information about troubleshooting, see Troubleshoot an unreachable instance in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId.N**

The instance IDs.

Type: Array of strings

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example reboots two instances.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RebootInstances
&InstanceId.1=i-1234567890abcdef0
&InstanceId.2=i-0598c7d356eba48d7
&AUTHPARAMS
```

#### Sample Response

```
<RebootInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</RebootInstancesResponse>
```

# RegisterImage

Registers an AMI. When you're creating an instance-store backed AMI, registering the AMI is the final step in the creation process. For more information about creating AMIs, see Create an AMI from a snapshot and Create an instance-store backed AMI in the *Amazon EC2 User Guide*.

> **Note**
>
> For Amazon EBS-backed instances, CreateImage creates and registers the AMI in a single request, so you don't have to register the AMI yourself. We recommend that you always use CreateImage unless you have a specific reason to use RegisterImage.

If needed, you can deregister an AMI at any time. Any modifications you make to an AMI backed by an instance store volume invalidates its registration. If you make changes to an image, deregister the previous image and register the new image.

**Register a snapshot of a root device volume**

You can use `RegisterImage` to create an Amazon EBS-backed Linux AMI from a snapshot of a root device volume. You specify the snapshot using a block device mapping. You can't set the encryption state of the volume using the block device mapping. If the snapshot is encrypted, or encryption by default is enabled, the root volume of an instance launched from the AMI is encrypted.

For more information, see Create an AMI from a snapshot and Use encryption with EBS-backed AMIs in the *Amazon EC2 User Guide*.

**AWS Marketplace product codes**

If any snapshots have AWS Marketplace product codes, they are copied to the new AMI.

In most cases, AMIs for Windows, RedHat, SUSE, and SQL Server require correct licensing information to be present on the AMI. For more information, see Understand AMI billing information in the *Amazon EC2 User Guide*. When creating an AMI from a snapshot, the `RegisterImage` operation derives the correct billing information from the snapshot's metadata, but this requires the appropriate metadata to be present. To verify if the correct billing information was applied, check the `PlatformDetails` field on the new AMI. If the field is empty or doesn't match the expected operating system code (for example, Windows, RedHat, SUSE, or SQL), the

AMI creation was unsuccessful, and you should discard the AMI and instead create the AMI from an instance. For more information, see Create an AMI from an instance in the *Amazon EC2 User Guide*.

If you purchase a Reserved Instance to apply to an On-Demand Instance that was launched from an AMI with a billing product code, make sure that the Reserved Instance has the matching billing product code. If you purchase a Reserved Instance without the matching billing product code, the Reserved Instance is not applied to the On-Demand Instance. For information about how to obtain the platform details and billing information of an AMI, see Understand AMI billing information in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Architecture**

The architecture of the AMI.

Default: For Amazon EBS-backed AMIs, `i386`. For instance store-backed AMIs, the architecture specified in the manifest file.

Type: String

Valid Values: `i386 | x86_64 | arm64 | x86_64_mac | arm64_mac`

Required: No

**BillingProduct.N**

The billing product codes. Your account must be authorized to specify billing product codes.

If your account is not authorized to specify billing product codes, you can publish AMIs that include billable software and list them on the AWS Marketplace. You must first register as a seller on the AWS Marketplace. For more information, see Getting started as an AWS Marketplace seller and AMI-based products in AWS Marketplace in the *AWS Marketplace Seller Guide*.

Type: Array of strings

Required: No

**BlockDeviceMapping.N**

The block device mapping entries.

If you specify an Amazon EBS volume using the ID of an Amazon EBS snapshot, you can't specify the encryption state of the volume.

If you create an AMI on an Outpost, then all backing snapshots must be on the same Outpost or in the Region of that Outpost. AMIs on an Outpost that include local snapshots can be used to launch instances on the same Outpost only. For more information, Create AMIs from local snapshots in the *Amazon EBS User Guide*.

Type: Array of BlockDeviceMapping objects

Required: No

**BootMode**

The boot mode of the AMI. A value of `uefi-preferred` indicates that the AMI supports both UEFI and Legacy BIOS.

> **Note**
>
> The operating system contained in the AMI must be configured to support the specified boot mode.

For more information, see Instance launch behavior with Amazon EC2 boot modes in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `legacy-bios | uefi | uefi-preferred`

Required: No

**Description**

A description for your AMI.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EnaSupport**

Set to `true` to enable enhanced networking with ENA for the AMI and any instances that you launch from the AMI.

This option is supported only for HVM AMIs. Specifying this option with a PV AMI can make instances launched from the AMI unreachable.

Type: Boolean

Required: No

**ImageLocation**

The full path to your AMI manifest in Amazon S3 storage. The specified bucket must have the `aws-exec-read` canned access control list (ACL) to ensure that it can be accessed by Amazon EC2. For more information, see Canned ACL in the *Amazon S3 Service Developer Guide*.

Type: String

Required: No

**ImdsSupport**

Set to `v2.0` to indicate that IMDSv2 is specified in the AMI. Instances launched from this AMI will have `HttpTokens` automatically set to `required` so that, by default, the instance requires that IMDSv2 is used when requesting instance metadata. In addition, `HttpPutResponseHopLimit` is set to 2. For more information, see Configure the AMI in the *Amazon EC2 User Guide*.

> **Note**
>
> If you set the value to `v2.0`, make sure that your AMI software can support IMDSv2.

Type: String

Valid Values: `v2.0`

Required: No

**KernelId**

The ID of the kernel.

Type: String

Required: No

**Name**

A name for your AMI.

Constraints: 3-128 alphanumeric characters, parentheses (()), square brackets ([]), spaces ( ), periods (.), slashes (/), dashes (-), single quotes ('), at-signs (@), or underscores(_)

Type: String

Required: Yes

**RamdiskId**

The ID of the RAM disk.

Type: String

Required: No

**RootDeviceName**

The device name of the root device volume (for example, `/dev/sda1`).

Type: String

Required: No

**SriovNetSupport**

Set to `simple` to enable enhanced networking with the Intel 82599 Virtual Function interface for the AMI and any instances that you launch from the AMI.

There is no way to disable `sriovNetSupport` at this time.

This option is supported only for HVM AMIs. Specifying this option with a PV AMI can make instances launched from the AMI unreachable.

Type: String

Required: No

**TagSpecification.N**

The tags to apply to the AMI.

To tag the AMI, the value for `ResourceType` must be `image`. If you specify another value for `ResourceType`, the request fails.

To tag an AMI after it has been registered, see CreateTags.

Type: Array of TagSpecification objects

Required: No

**TpmSupport**

Set to `v2.0` to enable Trusted Platform Module (TPM) support. For more information, see NitroTPM in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `v2.0`

Required: No

**UefiData**

Base64 representation of the non-volatile UEFI variable store. To retrieve the UEFI data, use the GetInstanceUefiData command. You can inspect and modify the UEFI data by using the python-uefivars tool on GitHub. For more information, see UEFI Secure Boot for Amazon EC2 instances in the *Amazon EC2 User Guide*.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 64000.

Required: No

**VirtualizationType**

The type of virtualization (`hvm` | `paravirtual`).

Default: `paravirtual`

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**imageId**

The ID of the newly registered AMI.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example registers the AMI specified in the `my-new-image.manifest.xml` manifest file, located in the bucket called `myawsbucket`.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=RegisterImage
&ImageLocation=myawsbucket/my-new-image.manifest.xml
```

```
&AUTHPARAMS
```

### Sample Response

```
<RegisterImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imageId>ami-1a2b3c4d</imageId>
</RegisterImageResponse>
```

## Example 2

This example specifies a snapshot for the root device of an Amazon EBS-backed AMI.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RegisterImage
&RootDeviceName=/dev/sda1
&BlockDeviceMapping.1.DeviceName=/dev/sda1
&BlockDeviceMapping.1.Ebs.SnapshotId=snap-1234567890abcdef0
&Name=MyImage
&AUTHPARAMS
```

### Sample Response

```
<RegisterImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imageId>ami-1a2b3c4d</imageId>
</RegisterImageResponse>
```

## Example 3

This example registers an AMI with a block device mapping for three Amazon EBS volumes. The first volume is the root device volume based on an Amazon EBS snapshot. The second volume is based on another snapshot. The third volume is an empty 100 GiB Amazon EBS volume.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RegisterImage
&RootDeviceName=/dev/sda1
&BlockDeviceMapping.1.DeviceName=/dev/sda1
```

```
&BlockDeviceMapping.1.Ebs.SnapshotId=snap-1234567890abcdef0
&BlockDeviceMapping.2.DeviceName=/dev/sdb
&BlockDeviceMapping.2.Ebs.SnapshotId=snap-1234567890abcdef1
&BlockDeviceMapping.3.DeviceName=/dev/sdc
&BlockDeviceMapping.3.Ebs.VolumeSize=100
&Name=MyImage
&AUTHPARAMS
```

### Sample Response

```
<RegisterImageResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <imageId>ami-1a2b3c4d</imageId>
</RegisterImageResponse>
```

# RegisterInstanceEventNotificationAttributes

Registers a set of tag keys to include in scheduled event notifications for your resources.

To remove tags, use DeregisterInstanceEventNotificationAttributes.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceTagAttribute**

Information about the tag keys to register.

Type: RegisterInstanceTagAttributeRequest object

Required: No

## Response Elements

The following elements are returned by the service.

**instanceTagAttribute**

The resulting set of tag keys.

Type: InstanceTagNotificationAttribute object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# RegisterTransitGatewayMulticastGroupMembers

Registers members (network interfaces) with the transit gateway multicast group. A member is a network interface associated with a supported EC2 instance that receives multicast traffic. For more information, see Multicast on transit gateways in the *AWS Transit Gateways Guide*.

After you add the members, use SearchTransitGatewayMulticastGroups to verify that the members were added to the transit gateway multicast group.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**GroupIpAddress**

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

**NetworkInterfaceIds.N**

The group members' network interface IDs to register with the transit gateway multicast group.

Type: Array of strings

Required: Yes

**TransitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**registeredMulticastGroupMembers**

Information about the registered transit gateway multicast group members.

Type: TransitGatewayMulticastRegisteredGroupMembers object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example registers the network interface as a group member `eni-0e246d3269EXAMPLE` with the multicast domain `tgw-mcast-domain-0c4905cef7EXAMPLE`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RegisterTransitGatewayMulticastGroupMembers
&TransitGatewayMulticastDomainId=tgw-mcast-domain-0c4905cef7EXAMPLE
&NetworkInterfaceIds=eni-0e246d3269EXAMPLE
&AUTHPARAMS
```

#### Sample Response

```
<RegisterTransitGatewayMulticastGroupMembersResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
```

```
    <requestId>6f4167cd-0870-4858-8872-f1c34EXAMPLE</requestId>
    <registeredMulticastGroupMembers>
        <groupIpAddress>224.0.1.0</groupIpAddress>
        <registeredNetworkInterfaceIds>
            <item>eni-0e246d3269EXAMPLE</item>
        </registeredNetworkInterfaceIds>
        <transitGatewayMulticastDomainId>tgw-mcast-domain-0c4905cef7EXAMPLE</
transitGatewayMulticastDomainId>
    </registeredMulticastGroupMembers>
</RegisterTransitGatewayMulticastGroupMembersResponse>
```

# RegisterTransitGatewayMulticastGroupSources

Registers sources (network interfaces) with the specified transit gateway multicast group.

A multicast source is a network interface attached to a supported instance that sends multicast traffic. For more information about supported instances, see Multicast on transit gateways in the *AWS Transit Gateways Guide*.

After you add the source, use SearchTransitGatewayMulticastGroups to verify that the source was added to the multicast group.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**GroupIpAddress**

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

**NetworkInterfaceIds.N**

The group sources' network interface IDs to register with the transit gateway multicast group.

Type: Array of strings

Required: Yes

**TransitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**registeredMulticastGroupSources**

Information about the transit gateway multicast group sources.

Type: TransitGatewayMulticastRegisteredGroupSources object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example registers the network interface as a group source `eni-07f290fc3cEXAMPLE` with the multicast domain `tgw-mcast-domain-0c4905cef7EXAMPLE`.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=RegisterTransitGatewayMulticastGroupSources
&TransitGatewayMulticastDomainId=tgw-mcast-domain-0c4905cef7EXAMPLE
&NetworkInterfaceIds=eni-07f290fc3cEXAMPLE
&AUTHPARAMS
```

**Sample Response**

```
<RegisterTransitGatewayMulticastGroupSourcesResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
```

```
    <requestId>b66c84ed-eb8a-4e6d-8d79-2347fEXAMPLE</requestId>
    <registeredMulticastGroupSources>
        <groupIpAddress>224.0.1.0</groupIpAddress>
        <registeredNetworkInterfaceIds>
            <item>eni-07f290fc3cEXAMPLE</item>
        </registeredNetworkInterfaceIds>
        <transitGatewayMulticastDomainId>tgw-mcast-domain-0c4905cef7EXAMPLE</
transitGatewayMulticastDomainId>
    </registeredMulticastGroupSources>
</RegisterTransitGatewayMulticastGroupSourcesResponse>
```

# RejectCapacityReservationBillingOwnership

Rejects a request to assign billing of the available capacity of a shared Capacity Reservation to your account. For more information, see Billing assignment for shared Amazon EC2 Capacity Reservations.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CapacityReservationId**

The ID of the Capacity Reservation for which to reject the request.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# RejectTransitGatewayClientVpnAttachment

Rejects a Transit Gateway attachment request for a Client VPN endpoint. The Transit Gateway owner can reject the attachment request to prevent the Client VPN endpoint from routing traffic through the Transit Gateway.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**TransitGatewayAttachmentId**

The ID of the Transit Gateway attachment.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**transitGatewayClientVpnAttachment**

Information about the Transit Gateway Client VPN attachment.

Type: TransitGatewayClientVpnAttachment object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example rejects a Transit Gateway Client VPN attachment.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RejectTransitGatewayClientVpnAttachment
&TransitGatewayAttachmentId=tgw-attach-0a34fe6b4fEXAMPLE
&AUTHPARAMS
```

#### Sample Response

```
<RejectTransitGatewayClientVpnAttachmentResult xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>691de4ea-32ef-447b-b4f8-d8463EXAMPLE</requestId>
    <transitGatewayClientVpnAttachment>
        <transitGatewayAttachmentId>tgw-attach-0a34fe6b4fEXAMPLE</
transitGatewayAttachmentId>
        <transitGatewayId>tgw-0262a0e521EXAMPLE</transitGatewayId>
        <clientVpnEndpointId>cvpn-endpoint-00c5d11fc4EXAMPLE</clientVpnEndpointId>
        <state>rejected</state>
    </transitGatewayClientVpnAttachment>
</RejectTransitGatewayClientVpnAttachmentResult>
```

# RejectTransitGatewayMulticastDomainAssociations

Rejects a request to associate cross-account subnets with a transit gateway multicast domain.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**SubnetIds.N**

The IDs of the subnets to associate with the transit gateway multicast domain.

Type: Array of strings

Required: No

**TransitGatewayAttachmentId**

The ID of the transit gateway attachment.

Type: String

Required: No

**TransitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**associations**

Information about the multicast domain associations.

Type: TransitGatewayMulticastDomainAssociations object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# RejectTransitGatewayPeeringAttachment

Rejects a transit gateway peering attachment request.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**TransitGatewayAttachmentId**

The ID of the transit gateway peering attachment.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**transitGatewayPeeringAttachment**

The transit gateway peering attachment.

Type: TransitGatewayPeeringAttachment object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example rejects the specified transit gateway peering attachment by specifying its attachment ID.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RejectTransitGatewayPeeringAttachment
&TransitGatewayAttachmentId=tgw-attach-12345678901abcd12
&AUTHPARAMS
```

## See Also

# RejectTransitGatewayVpcAttachment

Rejects a request to attach a VPC to a transit gateway.

The VPC attachment must be in the `pendingAcceptance` state. Use DescribeTransitGatewayVpcAttachments to view your pending VPC attachment requests. Use AcceptTransitGatewayVpcAttachment to accept a VPC attachment request.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**TransitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**transitGatewayVpcAttachment**

Information about the attachment.

Type: TransitGatewayVpcAttachment object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# RejectVpcEndpointConnections

Rejects VPC endpoint connection requests to your VPC endpoint service.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ServiceId**

The ID of the service.

Type: String

Required: Yes

**VpcEndpointId.N**

The IDs of the VPC endpoints.

Type: Array of strings

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**unsuccessful**

Information about the endpoints that were not rejected, if applicable.

Type: Array of UnsuccessfulItem objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example rejects the request for VPC endpoint `vpce-0c1308d7312217cd7` to connect to your service `vpce-svc-03d5ebb7d9579a2b3`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RejectVpcEndpointConnections
&ServiceId=vpce-svc-03d5ebb7d9579a2b3
&VpcEndpointId.1=vpce-0c1308d7312217cd7
&AUTHPARAMS
```

#### Sample Response

```
<RejectVpcEndpointConnectionsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>986a2264-8a40-4da8-8f11-e8aaexample</requestId>
    <unsuccessful/>
</RejectVpcEndpointConnectionsResponse>
```

# RejectVpcPeeringConnection

Rejects a VPC peering connection request. The VPC peering connection must be in the `pending-acceptance` state. Use the DescribeVpcPeeringConnections request to view your outstanding VPC peering connection requests. To delete an active VPC peering connection, or to delete a VPC peering connection request that you initiated, use DeleteVpcPeeringConnection.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VpcPeeringConnectionId**

The ID of the VPC peering connection.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example rejects the specified VPC peering connection request.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RejectVpcPeeringConnection
&vpcPeeringConnectionId=pcx-1a2b3c4d
&AUTHPARAMS
```

#### Sample Response

```
<RejectVpcPeeringConnectionResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>7a62c49f-347e-4fc4-9331-6e8eEXAMPLE</requestId>
   <return>true</return>
</RejectVpcPeeringConnectionResponse>
```

# ReleaseAddress

Releases the specified Elastic IP address.

[Default VPC] Releasing an Elastic IP address automatically disassociates it from any instance that it's associated with. Alternatively, you can disassociate an Elastic IP address without releasing it.

[Nondefault VPC] You must disassociate the Elastic IP address before you can release it. Otherwise, Amazon EC2 returns an error (`InvalidIPAddress.InUse`).

After releasing an Elastic IP address, it is released to the IP address pool. Be sure to update your DNS records and any servers or devices that communicate with the address. If you attempt to release an Elastic IP address that you already released, you'll get an `AuthFailure` error if the address is already allocated to another AWS account.

After you release an Elastic IP address, you might be able to recover it. For more information, see Release an Elastic IP address.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AllocationId**

The allocation ID. This parameter is required.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**NetworkBorderGroup**

The set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses.

If you provide an incorrect network border group, you receive an `InvalidAddress.NotFound` error.

Type: String

Required: No

**PublicIp**

Deprecated.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example releases the specified Elastic IP address.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ReleaseAddress
&AllocationId=eipalloc-5723d13e
&AUTHPARAMS
```

# See Also

# ReleaseHosts

When you no longer want to use an On-Demand Dedicated Host it can be released. On-Demand billing is stopped and the host goes into `released` state. The host ID of Dedicated Hosts that have been released can no longer be specified in another request, for example, to modify the host. You must stop or terminate all instances on a host before it can be released.

When Dedicated Hosts are released, it may take some time for them to stop counting toward your limit and you may receive capacity errors when trying to allocate new Dedicated Hosts. Wait a few minutes and then try again.

Released hosts still appear in a DescribeHosts response.

## Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**HostId.N**

The IDs of the Dedicated Hosts to release.

Type: Array of strings

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**successful**

The IDs of the Dedicated Hosts that were successfully released.

Type: Array of strings

**unsuccessful**

The IDs of the Dedicated Hosts that could not be released, including an error message.

Type: Array of UnsuccessfulItem objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This releases a Dedicated Host successfully.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ReleaseHosts
&HostId=h-00548908djdsgfs
&AUTHPARAMS
```

#### Sample Response

```
<ReleaseHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <unsuccessful/>
    <successful>
        <item>h-00548908djdsgfs</item>
    </successful>
</ReleaseHostsResponse>
```

### Example

This request is unsuccessful.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ReleaseHosts
&HostId=h-00548908djdsgfs
```

```
&AUTHPARAMS
```

### Sample Response

```
<ReleaseHostsResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <unsuccessful>
        <item>
       <error>
            <message>Dedicated host 'h-00548908djdsgfs' cannot be released as it is
 occupied</message>
            <code>Client.InvalidHost.Occupied</code<
       </error>
       <resourceId>h-00548908djdsgfs</resourceId>
        </item>
    </unsuccessful>
    <successful/>
</ReleaseHostsResponse>
```

# ReleaseIpamPoolAllocation

Release an allocation within an IPAM pool. The Region you use should be the IPAM pool locale. The locale is the AWS Region where this IPAM pool is available for allocations. You can only use this action to release manual allocations. To remove an allocation for a resource without deleting the resource, set its monitored state to false using ModifyIpamResourceCidr. For more information, see Release an allocation in the *Amazon VPC IPAM User Guide*.

> **Note**
>
> All EC2 API actions follow an eventual consistency model.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Cidr**

The CIDR of the allocation you want to release.

Type: String

Required: Yes

**DryRun**

A check for whether you have the required permissions for the action without actually making the request and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**IpamPoolAllocationId**

The ID of the allocation.

Type: String

Required: Yes

**IpamPoolId**

The ID of the IPAM pool which contains the allocation you want to release.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**success**

Indicates if the release was successful.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ReplaceIamInstanceProfileAssociation

Replaces an IAM instance profile for the specified running instance. You can use this action to change the IAM instance profile that's associated with an instance without having to disassociate the existing IAM instance profile first.

Use DescribeIamInstanceProfileAssociations to get the association ID.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AssociationId**

The ID of the existing IAM instance profile association.

Type: String

Required: Yes

**IamInstanceProfile**

The IAM instance profile.

Type: IamInstanceProfileSpecification object

Required: Yes

## Response Elements

The following elements are returned by the service.

**iamInstanceProfileAssociation**

Information about the IAM instance profile association.

Type: IamInstanceProfileAssociation object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example replaces the IAM instance profile represented by the association `iip-assoc-060bae234aac2e7fa` with the IAM instance profile named `AdminProfile`.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ReplaceIamInstanceProfileAssociation
&AssociationId=iip-assoc-060bae234aac2e7fa
&IamInstanceProfile.Name=AdminProfile
&AUTHPARAMS
```

#### Sample Response

```
<ReplaceIamInstanceProfileAssociationResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>ba40aa4c-d788-4f24-8a34-example</requestId>
    <iamInstanceProfileAssociation>
        <associationId>iip-assoc-08049da59357d598c</associationId>
        <iamInstanceProfile>
            <arn>arn:aws:iam::123456789012:instance-profile/AdminRole</arn>
            <id>AIPAI5IVIHMFFYY2DKV5Y</id>
        </iamInstanceProfile>
        <instanceId>i-1234567890abcdef0</instanceId>
        <state>associating</state>
    </iamInstanceProfileAssociation>
</ReplaceIamInstanceProfileAssociationResponse>
```

# ReplaceImageCriteriaInAllowedImagesSettings

Sets or replaces the criteria for Allowed AMIs.

> **Note**
>
> The Allowed AMIs feature does not restrict the AMIs owned by your account. Regardless of the criteria you set, the AMIs created by your account will always be discoverable and usable by users in your account.

For more information, see Control the discovery and use of AMIs in Amazon EC2 with Allowed AMIs in *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ImageCriterion.N**

The list of criteria that are evaluated to determine whether AMIs are discoverable and usable in the account in the specified AWS Region.

Type: Array of ImageCriterionRequest objects

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Ruby V3

# ReplaceNetworkAclAssociation

Changes which network ACL a subnet is associated with. By default when you create a subnet, it's automatically associated with the default network ACL. For more information, see Network ACLs in the *Amazon VPC User Guide*.

This is an idempotent operation.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AssociationId**

The ID of the current association between the original network ACL and the subnet.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**NetworkAclId**

The ID of the new network ACL to associate with the subnet.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**newAssociationId**

The ID of the new association.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example starts with a network ACL associated with a subnet, and a corresponding association ID `aclassoc-e5b95c8c`. You want to associate a different network ACL (`acl-5fb85d36`) with the subnet. The result is a new association ID representing the new association.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=ReplaceNetworkAclAssociation
&AssociationId=aclassoc-e5b95c8c
&NetworkAclId=acl-5fb85d36
&AUTHPARAMS
```

**Sample Response**

```
<ReplaceNetworkAclAssociationResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <newAssociationId>aclassoc-17b85d7e</newAssociationId>
</ReplaceNetworkAclAssociationResponse>
```

# ReplaceNetworkAclEntry

Replaces an entry (rule) in a network ACL. For more information, see Network ACLs in the *Amazon VPC User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CidrBlock**

The IPv4 network range to allow or deny, in CIDR notation (for example `172.16.0.0/24`).

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Egress**

Indicates whether to replace the egress rule.

Default: If no value is specified, we replace the ingress rule.

Type: Boolean

Required: Yes

**Icmp**

ICMP protocol: The ICMP or ICMPv6 type and code. Required if specifying protocol 1 (ICMP) or protocol 58 (ICMPv6) with an IPv6 CIDR block.

Type: IcmpTypeCode object

Required: No

**Ipv6CidrBlock**

The IPv6 network range to allow or deny, in CIDR notation (for example `2001:bd8:1234:1a00::/64`).

Type: String

Required: No

**NetworkAclId**

The ID of the ACL.

Type: String

Required: Yes

**PortRange**

TCP or UDP protocols: The range of ports the rule applies to. Required if specifying protocol 6 (TCP) or 17 (UDP).

Type: PortRange object

Required: No

**Protocol**

The protocol number. A value of "-1" means all protocols. If you specify "-1" or a protocol number other than "6" (TCP), "17" (UDP), or "1" (ICMP), traffic on all ports is allowed, regardless of any ports or ICMP types or codes that you specify. If you specify protocol "58" (ICMPv6) and specify an IPv4 CIDR block, traffic for all ICMP types and codes allowed, regardless of any that you specify. If you specify protocol "58" (ICMPv6) and specify an IPv6 CIDR block, you must specify an ICMP type and code.

Type: String

Required: Yes

**RuleAction**

Indicates whether to allow or deny the traffic that matches the rule.

Type: String

Valid Values: `allow | deny`

Required: Yes

**RuleNumber**

The rule number of the entry to replace.

Type: Integer

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example replaces the egress entry numbered `110` in the specified network ACL. The new rule denies egress traffic destined for any IPv4 address (`0.0.0.0/0`) on TCP port 139.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ReplaceNetworkAclEntry
```

```
&NetworkAclId=acl-2cb85d45
&RuleNumber=110
&Protocol="6"
&RuleAction=deny
&Egress=true
&CidrBlock=0.0.0.0/0
&PortRange.From=139
&PortRange.To=139
&AUTHPARAMS
```

### Sample Response

```
<ReplaceNetworkAclEntryResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</ReplaceNetworkAclEntryResponse>
```

# ReplaceRoute

Replaces an existing route within a route table in a VPC.

You must specify either a destination CIDR block or a prefix list ID. You must also specify exactly one of the resources from the parameter list, or reset the local route to its default target.

For more information, see Route tables in the *Amazon VPC User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CarrierGatewayId**

[IPv4 traffic only] The ID of a carrier gateway.

Type: String

Required: No

**CoreNetworkArn**

The Amazon Resource Name (ARN) of the core network.

Type: String

Required: No

**DestinationCidrBlock**

The IPv4 CIDR address block used for the destination match. The value that you provide must match the CIDR of an existing route in the table.

Type: String

Required: No

**DestinationIpv6CidrBlock**

The IPv6 CIDR address block used for the destination match. The value that you provide must match the CIDR of an existing route in the table.

Type: String

Required: No

**DestinationPrefixListId**

The ID of the prefix list for the route.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EgressOnlyInternetGatewayId**

[IPv6 traffic only] The ID of an egress-only internet gateway.

Type: String

Required: No

**GatewayId**

The ID of an internet gateway or virtual private gateway.

Type: String

Required: No

**InstanceId**

The ID of a NAT instance in your VPC.

Type: String

Required: No

**LocalGatewayId**

The ID of the local gateway.

Type: String

Required: No

**LocalTarget**

Specifies whether to reset the local route to its default target (`local`).

Type: Boolean

Required: No

**NatGatewayId**

[IPv4 traffic only] The ID of a NAT gateway.

Type: String

Required: No

**NetworkInterfaceId**

The ID of a network interface.

Type: String

Required: No

**OdbNetworkArn**

The Amazon Resource Name (ARN) of the ODB network.

Type: String

Required: No

**RouteTableId**

The ID of the route table.

Type: String

Required: Yes

**TransitGatewayId**

The ID of a transit gateway.

Type: String

Required: No

**VpcEndpointId**

The ID of a VPC endpoint. Supported for Gateway Load Balancer endpoints only.

Type: String

Required: No

**VpcPeeringConnectionId**

The ID of a VPC peering connection.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example 1

This example replaces a route in the specified route table. The new route matches the IPv4 CIDR `10.0.0.0/8` and sends the traffic to the virtual private gateway with the ID `vgw-123456abcde123456`.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ReplaceRoute
&RouteTableId=rtb-11223344556677889
&DestinationCidrBlock=10.0.0.0/8
&GatewayId=vgw-123456abcde123456
&AUTHPARAMS
```

### Sample Response

```
<ReplaceRouteResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</ReplaceRouteResponse>
```

## Example 2

This examples resets the target for the default local route.

### Sample Request

```
https://ec2.amazonaws.com/?Action=ReplaceRoute
&RouteTableId=rtb-11223344556677889
&DestinationCidrBlock=10.0.0.0/16
&LocalTarget=true
&AUTHPARAMS
```

# ReplaceRouteTableAssociation

Changes the route table associated with a given subnet, internet gateway, or virtual private gateway in a VPC. After the operation completes, the subnet or gateway uses the routes in the new route table. For more information about route tables, see Route tables in the *Amazon VPC User Guide*.

You can also use this operation to change which table is the main route table in the VPC. Specify the main route table's association ID and the route table ID of the new main route table.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AssociationId**

The association ID.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**RouteTableId**

The ID of the new route table to associate with the subnet.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**associationState**

The state of the association.

Type: RouteTableAssociationState object

**newAssociationId**

The ID of the new association.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example starts with a route table associated with a subnet, and a corresponding association ID `rtbassoc-04ca27a6914a0b4f`. You want to associate a different route table (table `rtb-1a2b3c4d1a2b3c4d1`) to the subnet. The result is a new association ID representing the new association.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ReplaceRouteTableAssociation
&AssociationId=rtbassoc-04ca27a6914a0b4f
&RouteTableId=rtb-1a2b3c4d1a2b3c4d1
&AUTHPARAMS
```

### Sample Response

```
<ReplaceRouteTableAssociationResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <newAssociationId>rtbassoc-11223344556677889</newAssociationId>
</ReplaceRouteTableAssociationResponse>
```

# ReplaceTransitGatewayRoute

Replaces the specified route in the specified transit gateway route table.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Blackhole**

Indicates whether traffic matching this route is to be dropped.

Type: Boolean

Required: No

**DestinationCidrBlock**

The CIDR range used for the destination match. Routing decisions are based on the most specific match.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**TransitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

**TransitGatewayRouteTableId**

The ID of the route table.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**route**

Information about the modified route.

Type: TransitGatewayRoute object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# ReplaceVpnTunnel

Trigger replacement of specified VPN tunnel.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ApplyPendingMaintenance**

Trigger pending tunnel endpoint maintenance.

Type: Boolean

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VpnConnectionId**

The ID of the Site-to-Site VPN connection.

Type: String

Required: Yes

**VpnTunnelOutsideIpAddress**

The external IP address of the VPN tunnel.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Confirmation of replace tunnel operation.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

# ReportInstanceStatus

Submits feedback about the status of an instance. The instance must be in the `running` state. If your experience with the instance differs from the instance status returned by DescribeInstanceStatus, use ReportInstanceStatus to report your experience with the instance. Amazon EC2 collects this information to improve the accuracy of status checks.

Use of this action does not change the value returned by DescribeInstanceStatus.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Description**

*This parameter has been deprecated.*

Descriptive text about the health state of your instance.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EndTime**

The time at which the reported instance health state ended.

Type: Timestamp

Required: No

**InstanceId.N**

The instances.

Type: Array of strings

Required: Yes

**ReasonCode.N**

The reason codes that describe the health state of your instance.

- `instance-stuck-in-state`: My instance is stuck in a state.
- `unresponsive`: My instance is unresponsive.
- `not-accepting-credentials`: My instance is not accepting my credentials.
- `password-not-available`: A password is not available for my instance.
- `performance-network`: My instance is experiencing performance problems that I believe are network related.
- `performance-instance-store`: My instance is experiencing performance problems that I believe are related to the instance stores.
- `performance-ebs-volume`: My instance is experiencing performance problems that I believe are related to an EBS volume.
- `performance-other`: My instance is experiencing performance problems.
- `other`: [explain using the description parameter]

Type: Array of strings

Valid Values: `instance-stuck-in-state | unresponsive | not-accepting-credentials | password-not-available | performance-network | performance-instance-store | performance-ebs-volume | performance-other | other`

Required: Yes

**StartTime**

The time at which the reported instance health state began.

Type: Timestamp

Required: No

**Status**

The status of all instances listed.

Type: String

Valid Values: `ok | impaired`

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example reports instance health state for two instances.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=ReportInstanceStatus
&Status=impaired
&InstanceId.1=i-1234567890abcdef0
```

```
&InstanceId.2=i-0598c7d356eba48d7
&AUTHPARAMS
```

### Example 2

This example reports instance health state for two instances with reason codes.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ReportInstanceStatus
&Description=Description+of+my+issue.
&Status=impaired
&InstanceId.1=i-1234567890abcdef0
&InstanceId.2=i-0598c7d356eba48d7
&ReasonCode.1=instance-performance-network
&ReasonCode.2=instance-performance-disk
&AUTHPARAMS
```

# RequestSpotFleet

Creates a Spot Fleet request.

The Spot Fleet request specifies the total target capacity and the On-Demand target capacity. Amazon EC2 calculates the difference between the total capacity and On-Demand capacity, and launches the difference as Spot capacity.

You can submit a single request that includes multiple launch specifications that vary by instance type, AMI, Availability Zone, or subnet.

By default, the Spot Fleet requests Spot Instances in the Spot Instance pool where the price per unit is the lowest. Each launch specification can include its own instance weighting that reflects the value of the instance type to your application workload.

Alternatively, you can specify that the Spot Fleet distribute the target capacity across the Spot pools included in its launch specifications. By ensuring that the Spot Instances in your Spot Fleet are in different Spot pools, you can improve the availability of your fleet.

You can specify tags for the Spot Fleet request and instances launched by the fleet. You cannot tag other resource types in a Spot Fleet request because only the `spot-fleet-request` and `instance` resource types are supported.

For more information, see Spot Fleet requests in the *Amazon EC2 User Guide*.

> **Important**
>
> We strongly discourage using the RequestSpotFleet API because it is a legacy API with no planned investment. For options for requesting Spot Instances, see Which is the best Spot request method to use? in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**SpotFleetRequestConfig**

The configuration for the Spot Fleet request.

Type: SpotFleetRequestConfigData object

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**spotFleetRequestId**

The ID of the Spot Fleet request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example creates a Spot Fleet request with two launch specifications.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RequestSpotFleet
&SpotFleetRequestConfig.IamFleetRole=arn:aws:iam::123456789011:role/spot-fleet-role
&SpotFleetRequestConfig.TargetCapacity=5
&SpotFleetRequestConfig.LaunchSpecifications.1.ImageId=ami-1ecae776
&SpotFleetRequestConfig.LaunchSpecifications.1.InstanceType=m4.large
&SpotFleetRequestConfig.LaunchSpecifications.1.SubnetId=subnet-1a2b3c4d
&SpotFleetRequestConfig.LaunchSpecifications.2.ImageId=ami-1ecae776
&SpotFleetRequestConfig.LaunchSpecifications.2.InstanceType=m3.medium
&SpotFleetRequestConfig.LaunchSpecifications.2.SubnetId=subnet-1a2b3c4d
&AUTHPARAMS
```

### Sample Response

```
<RequestSpotFleetResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>60262cc5-2bd4-4c8d-98ed-example</requestId>
    <spotFleetRequestId>sfr-123f8fc2-cb31-425e-abcd-example2710</spotFleetRequestId>
</RequestSpotFleetResponse>
```

# RequestSpotInstances

Creates a Spot Instance request.

For more information, see Work with Spot Instance in the *Amazon EC2 User Guide*.

> **Important**
>
> We strongly discourage using the RequestSpotInstances API because it is a legacy API with no planned investment. For options for requesting Spot Instances, see Which is the best Spot request method to use? in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AvailabilityZoneGroup**

The user-specified name for a logical grouping of requests.

When you specify an Availability Zone group in a Spot Instance request, all Spot Instances in the request are launched in the same Availability Zone. Instance proximity is maintained with this parameter, but the choice of Availability Zone is not. The group applies only to requests for Spot Instances of the same instance type. Any additional Spot Instance requests that are specified with the same Availability Zone group name are launched in that same Availability Zone, as long as at least one instance from the group is still active.

If there is no active instance running in the Availability Zone group that you specify for a new Spot Instance request (all instances are terminated, the request is expired, or the maximum price you specified falls below current Spot price), then Amazon EC2 launches the instance in any Availability Zone where the constraint can be met. Consequently, the subsequent set of Spot Instances could be placed in a different zone from the original request, even if you specified the same Availability Zone group.

Default: Instances are launched in any available Availability Zone.

Type: String

Required: No

**BlockDurationMinutes**

Deprecated.

Type: Integer

Required: No

**ClientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency in Amazon EC2 API requests in the *Amazon EC2 User Guide*.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceCount**

The maximum number of Spot Instances to launch.

Default: 1

Type: Integer

Required: No

**InstanceInterruptionBehavior**

The behavior when a Spot Instance is interrupted. The default is `terminate`.

Type: String

Valid Values: `hibernate | stop | terminate`

Required: No

**LaunchGroup**

The instance launch group. Launch groups are Spot Instances that launch together and terminate together.

Default: Instances are launched and terminated individually

Type: String

Required: No

**LaunchSpecification**

The launch specification.

Type: RequestSpotLaunchSpecification object

Required: No

**SpotPrice**

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.

Type: String

Required: No

**TagSpecification.N**

The key-value pair for tagging the Spot Instance request on creation. The value for `ResourceType` must be `spot-instances-request`, otherwise the Spot Instance request fails. To tag the Spot Instance request after it has been created, see CreateTags.

Type: Array of TagSpecification objects

Required: No

**Type**

The Spot Instance request type.

Default: `one-time`

Type: String

Valid Values: `one-time | persistent`

Required: No

**ValidFrom**

The start date of the request. If this is a one-time request, the request becomes active at this date and time and remains active until all instances launch, the request expires, or the request is canceled. If the request is persistent, the request becomes active at this date and time and remains active until it expires or is canceled.

The specified start date and time cannot be equal to the current date and time. You must specify a start date and time that occurs after the current date and time.

Type: Timestamp

Required: No

**ValidUntil**

The end date of the request, in UTC format (*YYYY*-*MM*-*DD*T*HH*:*MM*:*SS*Z).

- For a persistent request, the request remains active until the `ValidUntil` date and time is reached. Otherwise, the request remains active until you cancel it.
- For a one-time request, the request remains active until all instances launch, the request is canceled, or the `ValidUntil` date and time is reached. By default, the request is valid for 7 days from the date the request was created.

Type: Timestamp

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**spotInstanceRequestSet**

The Spot Instance requests.

Type: Array of SpotInstanceRequest objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example creates a one-time Spot Instance request for two instances. It does not include an Availability Zone or subnet, so Amazon EC2 selects an Availability Zone for you and launches the instances in the default subnet of the selected Availability Zone.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RequestSpotInstances
&InstanceCount=2
&Type=one-time
&LaunchSpecification.ImageId=ami-1a2b3c4d
&LaunchSpecification.KeyName=my-key-pair
&LaunchSpecification.SecurityGroupId.1=sg-1a2b3c4d
&LaunchSpecification.InstanceType=m3.medium
&LaunchSpecification.IamInstanceProfile.Name=s3access
&AUTHPARAMS
```

### Example 2

The following example includes an Availability Zone. Amazon EC2 launches the instances in the default subnet of the specified Availability Zone.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RequestSpotInstances
&InstanceCount=2
&Type=one-time
&LaunchSpecification.ImageId=ami-1a2b3c4d
&LaunchSpecification.KeyName=my-key-pair
&LaunchSpecification.SecurityGroupId.1=sg-1a2b3c4d
&LaunchSpecification.InstanceType=m3.medium
&LaunchSpecification.Placement.AvailabilityZone=us-west-2a
&LaunchSpecification.IamInstanceProfile.Name=s3access
&AUTHPARAMS
```

## Example 3

The following example includes a subnet. Amazon EC2 launches the instances in the specified subnet.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RequestSpotInstances
&InstanceCount=2
&Type=one-time
&LaunchSpecification.ImageId=ami-1a2b3c4d
&LaunchSpecification.KeyName=my-key-pair
&LaunchSpecification.SecurityGroupId.1=sg-1a2b3c4d
&LaunchSpecification.InstanceType=m3.medium
&LaunchSpecification.SubnetId=subnet-1a2b3c4d
&LaunchSpecification.IamInstanceProfile.Name=s3access
&AUTHPARAMS
```

# ResetAddressAttribute

Resets the attribute of the specified IP address. For requirements, see Using reverse DNS for email applications.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AllocationId**

[EC2-VPC] The allocation ID.

Type: String

Required: Yes

**Attribute**

The attribute of the IP address.

Type: String

Valid Values: `domain-name`

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**address**

Information about the IP address.

Type: AddressAttribute object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

# ResetEbsDefaultKmsKeyId

Resets the default AWS KMS key for EBS encryption for your account in this Region to the AWS managed KMS key for EBS.

After resetting the default KMS key to the AWS managed KMS key, you can continue to encrypt by a customer managed KMS key by specifying it when you create the volume. For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

## Request Parameters

For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**kmsKeyId**

The Amazon Resource Name (ARN) of the default KMS key for EBS encryption by default.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for JavaScript V3
- AWS SDK for Kotlin
- AWS SDK for PHP V3
- AWS SDK for Python
- AWS SDK for Ruby V3

# ResetFpgaImageAttribute

Resets the specified attribute of the specified Amazon FPGA Image (AFI) to its default value. You can only reset the load permission attribute.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Attribute**

The attribute.

Type: String

Valid Values: `loadPermission`

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**FpgaImageId**

The ID of the AFI.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example resets the load permissions for the specified AFI.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ResetFpgaImageAttribute
&FpgaImageId=afi-0d123e21abcc85abc
&Attribute=loadPermission
&AUTHPARAMS
```

#### Sample Response

```
<ResetFpgaImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>ccb58a32-30ee-4f9b-831c-639example</requestId>
    <return>true</return>
</ResetFpgaImageAttributeResponse>
```

# ResetImageAttribute

Resets an attribute of an AMI to its default value.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Attribute**

The attribute to reset (currently you can only reset the launch permission attribute).

Type: String

Valid Values: `launchPermission`

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ImageId**

The ID of the AMI.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example resets the `launchPermission` attribute for the specified AMI.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ResetImageAttribute
&ImageId=ami-61a54008
&Attribute=launchPermission
&AUTHPARAMS
```

#### Sample Response

```
<ResetImageAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ResetImageAttributeResponse>
```

## See Also

# ResetInstanceAttribute

Resets an attribute of an instance to its default value. To reset the `kernel` or `ramdisk`, the instance must be in a stopped state. To reset the `sourceDestCheck`, the instance can be either running or stopped.

The `sourceDestCheck` attribute controls whether source/destination checking is enabled. The default value is `true`, which means checking is enabled. This value must be `false` for a NAT instance to perform NAT. For more information, see NAT instances in the *Amazon VPC User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Attribute**

The attribute to reset.

Type: String

Valid Values: `kernel | ramdisk | sourceDestCheck`

Required: Yes

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example resets the `sourceDestCheck` attribute.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ResetInstanceAttribute
&InstanceId=i-1234567890abcdef0
&Attribute=sourceDestCheck
&AUTHPARAMS
```

#### Sample Response

```
<ResetInstanceAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ResetInstanceAttributeResponse>
```

- AWS SDK for Ruby V3

# ResetNetworkInterfaceAttribute

Resets a network interface attribute. You can specify only one attribute at a time.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**NetworkInterfaceId**

The ID of the network interface.

Type: String

Required: Yes

**SourceDestCheck**

The source/destination checking attribute. Resets the value to `true`.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

- AWS SDK for Python
- AWS SDK for Ruby V3

# ResetSnapshotAttribute

Resets permission settings for the specified snapshot.

For more information about modifying snapshot permissions, see Share a snapshot in the *Amazon EBS User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Attribute**

The attribute to reset. Currently, only the attribute for permission to create volumes can be reset.

Type: String

Valid Values: `productCodes | createVolumePermission`

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**SnapshotId**

The ID of the snapshot.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example resets the permissions for `snap-1234567890abcdef0`, making it a private snapshot that can only be used by the account that created it.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=ResetSnapshotAttribute
&SnapshotId=snap-1234567890abcdef0
&Attribute=createVolumePermission
&AUTHPARAMS
```

#### Sample Response

```
<ResetSnapshotAttributeResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</ResetSnapshotAttributeResponse>
```

# RestoreAddressToClassic

> **Note**
>
> This action is deprecated.

Restores an Elastic IP address that was previously moved to the EC2-VPC platform back to the EC2-Classic platform. You cannot move an Elastic IP address that was originally allocated for use in EC2-VPC. The Elastic IP address must not be associated with an instance or network interface.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PublicIp**

The Elastic IP address.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**publicIp**

The Elastic IP address.

Type: String

**requestId**

The ID of the request.

Type: String

**status**

The move status for the IP address.

Type: String

Valid Values: `MoveInProgress | InVpc | InClassic`

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# RestoreImageFromRecycleBin

Restores an AMI from the Recycle Bin. For more information, see Recover deleted Amazon EBS snapshots and EBS-back AMIs with Recycle Bin in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ImageId**

The ID of the AMI to restore.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS Command Line Interface V2
- AWS SDK for .NET V4
- AWS SDK for C++

# RestoreManagedPrefixListVersion

Restores the entries from a previous version of a managed prefix list to a new version of the prefix list.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CurrentVersion**

The current version number for the prefix list.

Type: Long

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PrefixListId**

The ID of the prefix list.

Type: String

Required: Yes

**PreviousVersion**

The version to restore.

Type: Long

Required: Yes

## Response Elements

The following elements are returned by the service.

**prefixList**

Information about the prefix list.

Type: ManagedPrefixList object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example restores the entries from version 1 of the specified prefix list.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RestoreManagedPrefixListVersion
&PrefixListId=pl-0123123123123aabb
&CurrentVersion=3
&PreviousVersion=1
&AUTHPARAMS
```

#### Sample Response

```
<RestoreManagedPrefixListVersionResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>aeb3faff-8938-41a0-9747-example</requestId>
    <prefixList>
        <addressFamily>IPv4</addressFamily>
        <maxEntries>10</maxEntries>
```

```
        <ownerId>123456789012</ownerId>
        <prefixListArn>arn:aws:ec2:us-east-1:123456789012:prefix-list/
pl-0123123123123aabb</prefixListArn>
        <prefixListId>pl-0123123123123aabb</prefixListId>
        <prefixListName>tgw-attachments</prefixListName>
        <state>restore-in-progress</state>
        <version>3</version>
    </prefixList>
</RestoreManagedPrefixListVersionResponse>
```

## See Also

# RestoreSnapshotFromRecycleBin

Restores a snapshot from the Recycle Bin. For more information, see Restore snapshots from the Recycle Bin in the *Amazon EBS User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**SnapshotId**

The ID of the snapshot to restore.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**description**

The description for the snapshot.

Type: String

**encrypted**

Indicates whether the snapshot is encrypted.

Type: Boolean

**outpostArn**

The ARN of the Outpost on which the snapshot is stored. For more information, see Amazon EBS local snapshots on Outposts in the *Amazon EBS User Guide*.

Type: String

**ownerId**

The ID of the AWS account that owns the EBS snapshot.

Type: String

**progress**

The progress of the snapshot, as a percentage.

Type: String

**requestId**

The ID of the request.

Type: String

**snapshotId**

The ID of the snapshot.

Type: String

**sseType**

Reserved for future use.

Type: String

Valid Values: `sse-ebs | sse-kms | none`

**startTime**

The time stamp when the snapshot was initiated.

Type: Timestamp

**status**

The state of the snapshot.

Type: String

Valid Values: `pending | completed | error | recoverable | recovering`

**volumeId**

The ID of the volume that was used to create the snapshot.

Type: String

**volumeSize**

The size of the volume, in GiB.

Type: Integer

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

# RestoreSnapshotTier

Restores an archived Amazon EBS snapshot for use temporarily or permanently, or modifies the restore period or restore type for a snapshot that was previously temporarily restored.

For more information see Restore an archived snapshot and modify the restore period or restore type for a temporarily restored snapshot in the *Amazon EBS User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**PermanentRestore**

Indicates whether to permanently restore an archived snapshot. To permanently restore an archived snapshot, specify `true` and omit the **RestoreSnapshotTierRequest $TemporaryRestoreDays** parameter.

Type: Boolean

Required: No

**SnapshotId**

The ID of the snapshot to restore.

Type: String

Required: Yes

**TemporaryRestoreDays**

Specifies the number of days for which to temporarily restore an archived snapshot. Required for temporary restores only. The snapshot will be automatically re-archived after this period.

To temporarily restore an archived snapshot, specify the number of days and omit the **PermanentRestore** parameter or set it to `false`.

Type: Integer

Required: No

## Response Elements

The following elements are returned by the service.

**isPermanentRestore**

Indicates whether the snapshot is permanently restored. `true` indicates a permanent restore. `false` indicates a temporary restore.

Type: Boolean

**requestId**

The ID of the request.

Type: String

**restoreDuration**

For temporary restores only. The number of days for which the archived snapshot is temporarily restored.

Type: Integer

**restoreStartTime**

The date and time when the snapshot restore process started.

Type: Timestamp

**snapshotId**

The ID of the snapshot.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# RestoreVolumeFromRecycleBin

Restores a volume from the Recycle Bin. For more information, see Restore volumes from the Recycle Bin in the *Amazon EBS User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**VolumeId**

The ID of the volume to restore.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

# RevokeClientVpnIngress

Removes an ingress authorization rule from a Client VPN endpoint.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AccessGroupId**

The ID of the Active Directory group for which to revoke access.

Type: String

Required: No

**ClientVpnEndpointId**

The ID of the Client VPN endpoint with which the authorization rule is associated.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**RevokeAllGroups**

Indicates whether access should be revoked for all groups for a single `TargetNetworkCidr` that earlier authorized ingress for all groups using `AuthorizeAllGroups`. This does not impact other authorization rules that allowed ingress to the same `TargetNetworkCidr` with a specific `AccessGroupId`.

Type: Boolean

Required: No

**TargetNetworkCidr**

The IPv4 address range, in CIDR notation, of the network for which access is being removed.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**status**

The current state of the authorization rule.

Type: ClientVpnAuthorizationRuleStatus object

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example removes an authorization rule from a Client VPN endpoint.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=RevokeClientVpnIngress
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&TargetNetworkCidr=10.0.0.0/16
&RevokeAllGroups=true
```

```
&AUTHPARAMS
```

### Sample Response

```
<RevokeClientVpnIngressResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>691de4ea-32ef-447b-b4f8-d8463XAMPLE</requestId>
    <status>
        <code>revoking</code>
    </status>
</RevokeClientVpnIngressResponse>
```

- AWS SDK for Ruby V3

# RevokeSecurityGroupEgress

Removes the specified outbound (egress) rules from the specified security group.

You can specify rules using either rule IDs or security group rule properties. If you use rule properties, the values that you specify (for example, ports) must match the existing rule's values exactly. Each rule has a protocol, from and to ports, and destination (CIDR range, security group, or prefix list). For the TCP and UDP protocols, you must also specify the destination port or range of ports. For the ICMP protocol, you must also specify the ICMP type and code. If the security group rule has a description, you do not need to specify the description to revoke the rule.

For a default VPC, if the values you specify do not match the existing rule's values, no error is returned, and the output describes the security group rules that were not revoked.

AWS recommends that you describe the security group to verify that the rules were removed.

Rule changes are propagated to instances within the security group as quickly as possible. However, a small delay might occur.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CidrIp**

Not supported. Use a set of IP permissions to specify the CIDR.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**FromPort**

Not supported. Use a set of IP permissions to specify the port.

Type: Integer

Required: No

**GroupId**

The ID of the security group.

Type: String

Required: Yes

**IpPermissions.N**

The sets of IP permissions. You can't specify a destination security group and a CIDR IP address range in the same set of permissions.

Type: Array of IpPermission objects

Required: No

**IpProtocol**

Not supported. Use a set of IP permissions to specify the protocol name or number.

Type: String

Required: No

**SecurityGroupRuleId.N**

The IDs of the security group rules.

Type: Array of strings

Required: No

**SourceSecurityGroupName**

Not supported. Use a set of IP permissions to specify a destination security group.

Type: String

Required: No

**SourceSecurityGroupOwnerId**

Not supported. Use a set of IP permissions to specify a destination security group.

Type: String

Required: No

**ToPort**

Not supported. Use a set of IP permissions to specify the port.

Type: Integer

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

**revokedSecurityGroupRuleSet**

Details about the revoked security group rules.

Type: Array of RevokedSecurityGroupRule objects

**unknownIpPermissionSet**

The outbound rules that were unknown to the service. In some cases, `unknownIpPermissionSet` might be in a different format from the request parameter.

Type: Array of IpPermission objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example revokes the access that the specified security group has to the `205.192.0.0/16` and `205.159.0.0/16` IPv4 address ranges on TCP port 80.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RevokeSecurityGroupEgress
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=80
&IpPermissions.1.ToPort=80
&IpPermissions.1.IpRanges.1.CidrIp=205.192.0.0/16
&IpPermissions.1.IpRanges.2.CidrIp=205.159.0.0/16
&AUTHPARAMS
```

### Example 2

This example revokes the access that the specified security group has to the security group with the ID `sg-9a8d7f5c` on TCP port 1433.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RevokeSecurityGroupEgress
&GroupId=sg-1a2b3c4d
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=1433
&IpPermissions.1.ToPort=1433
&IpPermissions.1.Groups.1.GroupId=sg-9a8d7f5c
&AUTHPARAMS
```

### Example 3

This example revokes TCP port 22 access to the `203.0.113.4/32` address range for the security group `sg-112233`. The security group rule includes the description 'Access to office CT12'.

Specifying the description to revoke the rule is optional, but if you do specify the description, it must match the existing rule's value exactly.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RevokeSecurityGroupEgress
&GroupId=sg-112233
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=22
&IpPermissions.1.ToPort=22
&IpPermissions.1.IpRanges.1.CidrIp=203.0.113.4/32
&IpPermissions.1.IpRanges.1.Description=Access to office CT12
&AUTHPARAMS
```

# RevokeSecurityGroupIngress

Removes the specified inbound (ingress) rules from a security group.

You can specify rules using either rule IDs or security group rule properties. If you use rule properties, the values that you specify (for example, ports) must match the existing rule's values exactly. Each rule has a protocol, from and to ports, and source (CIDR range, security group, or prefix list). For the TCP and UDP protocols, you must also specify the destination port or range of ports. For the ICMP protocol, you must also specify the ICMP type and code. If the security group rule has a description, you do not need to specify the description to revoke the rule.

For a default VPC, if the values you specify do not match the existing rule's values, no error is returned, and the output describes the security group rules that were not revoked.

For a non-default VPC, if the values you specify do not match the existing rule's values, an `InvalidPermission.NotFound` client error is returned, and no rules are revoked.

AWS recommends that you describe the security group to verify that the rules were removed.

Rule changes are propagated to instances within the security group as quickly as possible. However, a small delay might occur.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CidrIp**

The CIDR IP address range. You can't specify this parameter when specifying a source security group.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**FromPort**

If the protocol is TCP or UDP, this is the start of the port range. If the protocol is ICMP, this is the ICMP type or -1 (all ICMP types).

Type: Integer

Required: No

**GroupId**

The ID of the security group.

Type: String

Required: No

**GroupName**

[Default VPC] The name of the security group. You must specify either the security group ID or the security group name in the request. For security groups in a nondefault VPC, you must specify the security group ID.

Type: String

Required: No

**IpPermissions.N**

The sets of IP permissions. You can't specify a source security group and a CIDR IP address range in the same set of permissions.

Type: Array of IpPermission objects

Required: No

**IpProtocol**

The IP protocol name (`tcp`, `udp`, `icmp`) or number (see Protocol Numbers). Use `-1` to specify all.

Type: String

Required: No

**SecurityGroupRuleId.N**

The IDs of the security group rules.

Type: Array of strings

Required: No

**SourceSecurityGroupName**

[Default VPC] The name of the source security group. You can't specify this parameter in combination with the following parameters: the CIDR IP address range, the start of the port range, the IP protocol, and the end of the port range. The source security group must be in the same VPC. To revoke a specific rule for an IP protocol and port range, use a set of IP permissions instead.

Type: String

Required: No

**SourceSecurityGroupOwnerId**

Not supported.

Type: String

Required: No

**ToPort**

If the protocol is TCP or UDP, this is the end of the port range. If the protocol is ICMP, this is the ICMP code or -1 (all ICMP codes).

Type: Integer

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

**revokedSecurityGroupRuleSet**

Details about the revoked security group rules.

Type: Array of RevokedSecurityGroupRule objects

**unknownIpPermissionSet**

The inbound rules that were unknown to the service. In some cases, `unknownIpPermissionSet` might be in a different format from the request parameter.

Type: Array of IpPermission objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example revokes TCP port 80 access from the `205.192.0.0/16` IPv4 address range for the security group named `websrv`. If the security group is for a VPC, specify the ID of the security group instead of the name.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=RevokeSecurityGroupIngress
&GroupName=websrv
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=80
```

```
&IpPermissions.1.ToPort=80
&IpPermissions.1.IpRanges.1.CidrIp=205.192.0.0/16
&AUTHPARAMS
```

### Sample Response

```
<RevokeSecurityGroupIngressResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</RevokeSecurityGroupIngressResponse>
```

## Example 2

This example revokes TCP port 22 (SSH) access from IPv6 range `2001:db8:1234:1a00::/64`.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RevokeSecurityGroupIngress
&GroupName=websrv
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=80
&IpPermissions.1.ToPort=80
&IpPermissions.1.Ipv6Ranges.1.CidrIpv6=2001:db8:1234:1a00::/64
&AUTHPARAMS
```

## Example 3

This example revokes TCP port 22 access from the `203.0.113.4/32` address range for the security group `sg-112233`. The security group rule includes the description 'Access from workstation 1a2b'. Specifying the description to revoke the rule is optional, but if you do specify the description, it must match the existing rule's value exactly.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RevokeSecurityGroupIngress
&GroupId=sg-112233
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=22
&IpPermissions.1.ToPort=22
&IpPermissions.1.IpRanges.1.CidrIp=203.0.113.4/32
&IpPermissions.1.IpRanges.1.Description=Access from workstation 1a2b
```

```
&AUTHPARAMS
```

# RunInstances

Launches the specified number of instances using an AMI for which you have permissions.

You can specify a number of options, or leave the default options. The following rules apply:

- If you don't specify a subnet ID, we choose a default subnet from your default VPC for you. If you don't have a default VPC, you must specify a subnet ID in the request.
- All instances have a network interface with a primary private IPv4 address. If you don't specify this address, we choose one from the IPv4 range of your subnet.
- Not all instance types support IPv6 addresses. For more information, see Instance types.
- If you don't specify a security group ID, we use the default security group for the VPC. For more information, see Security groups.
- If any of the AMIs have a product code attached for which the user has not subscribed, the request fails.

You can create a launch template, which is a resource that contains the parameters to launch an instance. When you launch an instance using RunInstances, you can specify the launch template instead of specifying the launch parameters.

To ensure faster instance launches, break up large requests into smaller batches. For example, create five separate launch requests for 100 instances each instead of one launch request for 500 instances.

`RunInstances` is subject to both request rate limiting and resource rate limiting. For more information, see Request throttling.

An instance is ready for you to use when it's in the `running` state. You can check the state of your instance using DescribeInstances. You can tag instances and EBS volumes during launch, after launch, or both. For more information, see CreateTags and Tagging your Amazon EC2 resources.

Linux instances have access to the public key of the key pair at boot. You can use this key to provide secure access to the instance. Amazon EC2 public images use this feature to provide secure access without passwords. For more information, see Key pairs.

For troubleshooting, see What to do if an instance immediately terminates, and Troubleshooting connecting to your instance.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AdditionalInfo**

Reserved.

Type: String

Required: No

**BlockDeviceMapping.N**

The block device mapping, which defines the EBS volumes and instance store volumes to attach to the instance at launch. For more information, see Block device mappings in the *Amazon EC2 User Guide*.

Type: Array of BlockDeviceMapping objects

Required: No

**CapacityReservationSpecification**

Information about the Capacity Reservation targeting option. If you do not specify this parameter, the instance's Capacity Reservation preference defaults to open, which enables it to run in any open Capacity Reservation that has matching attributes (instance type, platform, Availability Zone, and tenancy).

Type: CapacityReservationSpecification object

Required: No

**ClientToken**

Unique, case-sensitive identifier you provide to ensure the idempotency of the request. If you do not specify a client token, a randomly generated token is used for the request to ensure idempotency.

For more information, see Ensuring idempotency in Amazon EC2 API requests.

Constraints: Maximum 64 ASCII characters

Type: String

Required: No

**CpuOptions**

The CPU options for the instance. For more information, see Optimize CPU options in the *Amazon EC2 User Guide*.

Type: CpuOptionsRequest object

Required: No

**CreditSpecification**

The credit option for CPU usage of the burstable performance instance. Valid values are `standard` and `unlimited`. To change this attribute after launch, use ModifyInstanceCreditSpecification. For more information, see Burstable performance instances in the *Amazon EC2 User Guide*.

Default: `standard` (T2 instances) or `unlimited` (T3/T3a/T4g instances)

For T3 instances with `host` tenancy, only `standard` is supported.

Type: CreditSpecificationRequest object

Required: No

**DisableApiStop**

Indicates whether an instance is enabled for stop protection. For more information, see Enable stop protection for your EC2 instances.

Type: Boolean

Required: No

**DisableApiTermination**

Indicates whether termination protection is enabled for the instance. The default is `false`, which means that you can terminate the instance using the Amazon EC2 console, command line tools, or API. You can enable termination protection when you launch an instance, while the instance is running, or while the instance is stopped.

Type: Boolean

Required: No

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**EbsOptimized**

Indicates whether the instance is optimized for Amazon EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal Amazon EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

Default: `false`

Type: Boolean

Required: No

**ElasticGpuSpecification.N**

*This parameter has been deprecated.*

An elastic GPU to associate with the instance.

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Type: Array of ElasticGpuSpecification objects

Required: No

**ElasticInferenceAccelerator.N**

*This parameter has been deprecated.*

An elastic inference accelerator to associate with the instance.

> **Note**
>
> Amazon Elastic Inference is no longer available.

Type: Array of ElasticInferenceAccelerator objects

Required: No

**EnablePrimaryIpv6**

If you're launching an instance into a dual-stack or IPv6-only subnet, you can enable assigning a primary IPv6 address. A primary IPv6 address is an IPv6 GUA address associated with an ENI that you have enabled to use a primary IPv6 address. Use this option if an instance relies on its IPv6 address not changing. When you launch the instance, AWS will automatically assign an IPv6 address associated with the ENI attached to your instance to be the primary IPv6 address. Once you enable an IPv6 GUA address to be a primary IPv6, you cannot disable it. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. If you have multiple IPv6 addresses associated with an ENI attached to your instance and you enable a primary IPv6 address, the first IPv6 GUA address associated with the ENI becomes the primary IPv6 address.

Type: Boolean

Required: No

**EnclaveOptions**

Indicates whether the instance is enabled for AWS Nitro Enclaves. For more information, see AWS Nitro Enclaves User Guide.

You can't enable AWS Nitro Enclaves and hibernation on the same instance.

Type: EnclaveOptionsRequest object

Required: No

**HibernationOptions**

Indicates whether an instance is enabled for hibernation. This parameter is valid only if the instance meets the hibernation prerequisites. For more information, see Hibernate your Amazon EC2 instance in the *Amazon EC2 User Guide*.

You can't enable hibernation and AWS Nitro Enclaves on the same instance.

Type: HibernationOptionsRequest object

Required: No

**IamInstanceProfile**

The name or Amazon Resource Name (ARN) of an IAM instance profile.

Type: IamInstanceProfileSpecification object

Required: No

**ImageId**

The ID of the AMI. An AMI ID is required to launch an instance and must be specified here or in a launch template.

Type: String

Required: No

**InstanceInitiatedShutdownBehavior**

Indicates whether an instance stops or terminates when you initiate shutdown from the instance (using the operating system command for system shutdown).

Default: `stop`

Type: String

Valid Values: `stop | terminate`

Required: No

**InstanceMarketOptions**

The market (purchasing) option for the instances.

Type: InstanceMarketOptionsRequest object

Required: No

**InstanceType**

The instance type. For more information, see Amazon EC2 Instance Types Guide.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge | g4dn.xlarge | g4dn.2xlarge | g4dn.4xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.xlarge | g5.2xlarge | g5.4xlarge | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge | g5.48xlarge | g5g.xlarge | g5g.2xlarge | g5g.4xlarge | g5g.8xlarge | g5g.16xlarge | g5g.metal | hi1.4xlarge | hpc6a.48xlarge | hs1.8xlarge | h1.2xlarge | h1.4xlarge | h1.8xlarge | h1.16xlarge | i2.xlarge | i2.2xlarge | i2.4xlarge | i2.8xlarge | i3.large | i3.xlarge | i3.2xlarge | i3.4xlarge | i3.8xlarge | i3.16xlarge | i3.metal | i3en.large | i3en.xlarge | i3en.2xlarge | i3en.3xlarge | i3en.6xlarge |

Required: No

**Ipv6Address.N**

The IPv6 addresses from the range of the subnet to associate with the primary network interface. You cannot specify this option and the option to assign a number of IPv6 addresses

in the same request. You cannot specify this option if you've specified a minimum number of instances to launch.

You cannot specify this option and the network interfaces option in the same request.

Type: Array of InstanceIpv6Address objects

Required: No

**Ipv6AddressCount**

The number of IPv6 addresses to associate with the primary network interface. Amazon EC2 chooses the IPv6 addresses from the range of your subnet. You cannot specify this option and the option to assign specific IPv6 addresses in the same request. You can specify this option if you've specified a minimum number of instances to launch.

You cannot specify this option and the network interfaces option in the same request.

Type: Integer

Required: No

**KernelId**

The ID of the kernel.

> **Important**
>
> We recommend that you use PV-GRUB instead of kernels and RAM disks. For more information, see PV-GRUB in the *Amazon EC2 User Guide*.

Type: String

Required: No

**KeyName**

The name of the key pair. For more information, see Create a key pair for your EC2 instance.

> **Important**
>
> If you do not specify a key pair, you can't connect to the instance unless you choose an AMI that is configured to allow users another way to log in.

Type: String

Required: No

**LaunchTemplate**

The launch template. Any additional parameters that you specify for the new instance overwrite the corresponding parameters included in the launch template.

Type: LaunchTemplateSpecification object

Required: No

**LicenseSpecification.N**

The license configurations.

Type: Array of LicenseConfigurationRequest objects

Required: No

**MaintenanceOptions**

The maintenance and recovery options for the instance.

Type: InstanceMaintenanceOptionsRequest object

Required: No

**MaxCount**

The maximum number of instances to launch. If you specify a value that is more capacity than Amazon EC2 can launch in the target Availability Zone, Amazon EC2 launches the largest possible number of instances above the specified minimum count.

Constraints: Between 1 and the quota for the specified instance type for your account for this Region. For more information, see Amazon EC2 instance type quotas.

Type: Integer

Required: Yes

**MetadataOptions**

The metadata options for the instance. For more information, see Configure the Instance Metadata Service options.

Type: InstanceMetadataOptionsRequest object

Required: No

**MinCount**

The minimum number of instances to launch. If you specify a value that is more capacity than Amazon EC2 can provide in the target Availability Zone, Amazon EC2 does not launch any instances.

Constraints: Between 1 and the quota for the specified instance type for your account for this Region. For more information, see Amazon EC2 instance type quotas.

Type: Integer

Required: Yes

**Monitoring**

Specifies whether detailed monitoring is enabled for the instance.

Type: RunInstancesMonitoringEnabled object

Required: No

**NetworkInterface.N**

The network interfaces to associate with the instance.

Type: Array of InstanceNetworkInterfaceSpecification objects

Required: No

**NetworkPerformanceOptions**

Contains settings for the network performance options for the instance.

Type: InstanceNetworkPerformanceOptionsRequest object

Required: No

**Operator**

Reserved for internal use.

Type: OperatorRequest object

Required: No

**Placement**

The placement for the instance.

Type: Placement object

Required: No

**PrivateDnsNameOptions**

The options for the instance hostname. The default values are inherited from the subnet. Applies only if creating a network interface, not attaching an existing one.

Type: PrivateDnsNameOptionsRequest object

Required: No

**PrivateIpAddress**

The primary IPv4 address. You must specify a value from the IPv4 address range of the subnet.

Only one private IP address can be designated as primary. You can't specify this option if you've specified the option to designate a private IP address as the primary IP address in a network interface specification. You cannot specify this option if you're launching more than one instance in the request.

You cannot specify this option and the network interfaces option in the same request.

Type: String

Required: No

**RamdiskId**

The ID of the RAM disk to select. Some kernels require additional drivers at launch. Check the kernel requirements for information about whether you need to specify a RAM disk. To find kernel requirements, go to the AWS Resource Center and search for the kernel ID.

> **Important**
>
> We recommend that you use PV-GRUB instead of kernels and RAM disks. For more information, see PV-GRUB in the *Amazon EC2 User Guide*.

Type: String

Required: No

**SecondaryInterface.N**

The secondary interfaces to associate with the instance.

Type: Array of InstanceSecondaryInterfaceSpecificationRequest objects

Required: No

**SecurityGroup.N**

[Default VPC] The names of the security groups.

If you specify a network interface, you must specify any security groups as part of the network interface instead of using this parameter.

Default: Amazon EC2 uses the default security group.

Type: Array of strings

Required: No

**SecurityGroupId.N**

The IDs of the security groups.

If you specify a network interface, you must specify any security groups as part of the network interface instead of using this parameter.

Type: Array of strings

Required: No

**SubnetId**

The ID of the subnet to launch the instance into.

If you specify a network interface, you must specify any subnets as part of the network interface instead of using this parameter.

Type: String

Required: No

**TagSpecification.N**

The tags to apply to the resources that are created during instance launch.

You can specify tags for the following resources only:

- Instances
- Volumes
- Spot Instance requests
- Network interfaces

To tag a resource after it has been created, see CreateTags.

Type: Array of TagSpecification objects

Required: No

**UserData**

The user data to make available to the instance. User data must be base64-encoded. Depending on the tool or SDK that you're using, the base64-encoding might be performed for you. For more information, see Run commands at launch using instance user data.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**groupSet**

Not supported.

Type: Array of GroupIdentifier objects

**instancesSet**

The instances.

Type: Array of Instance objects

**ownerId**

The ID of the AWS account that owns the reservation.

Type: String

**requesterId**

The ID of the requester that launched the instances on your behalf (for example, AWS Management Console or Auto Scaling).

Type: String

**requestId**

The ID of the request.

Type: String

**reservationId**

The ID of the reservation.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example launches three instances using the specified AMI.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-60a54009
&MaxCount=3
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
```

```
&Placement.AvailabilityZone=us-east-1d
&AUTHPARAMS
```

## Example 2

This example launches an instance into the specified subnet. Because no network interface is specified, a new network interface is created.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-31814f58
&InstanceType=t2.micro
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
&SubnetId=subnet-b2a249da
&AUTHPARAMS
```

## Example 3

This example launches an instance into the specified subnet. The network interface specifies a primary private IPv4 address of `10.0.2.106` and two secondary private IPv4 addresses (`10.0.2.107` and `10.0.2.108`).

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-beb0caec
&InstanceType=t2.small
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&NetworkInterface.1.DeviceIndex=0
&NetworkInterface.1.PrivateIpAddresses.1.Primary=true
&NetworkInterface.1.PrivateIpAddresses.1.PrivateIpAddress=10.0.2.106
&NetworkInterface.1.PrivateIpAddresses.2.Primary=false
&NetworkInterface.1.PrivateIpAddresses.2.PrivateIpAddress=10.0.2.107
&NetworkInterface.1.PrivateIpAddresses.3.Primary=false
&NetworkInterface.1.PrivateIpAddresses.3.PrivateIpAddress=10.0.2.108
&NetworkInterface.1.SubnetId=subnet-a61dafcf
```

```
&AUTHPARAMS
```

## Example 4

This example launches a Dedicated Instance into the specified subnet.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-2a1fec43
&InstanceType=m6i.8xlarge
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
&SubnetId=subnet-dea63cb7
&Placement.Tenancy=dedicated
&AUTHPARAMS
```

## Example 5

This request launches an instance into the specified subnet, and requests a public IPv4 address for a new network interface with the device index of 0.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-1a2b3c4d
&InstanceType=m6i.8xlarge
&MaxCount=1
&MinCount=1
&NetworkInterface.1.DeviceIndex=0
&NetworkInterface.1.AssociatePublicIpAddress=true
&NetworkInterface.1.SubnetId=subnet-1a2b3c4d
&AUTHPARAMS
```

## Example 6

This request launches an instance with a block device mapping. There are two instance store volumes mapped to `/dev/sdc` and `/dev/sdd`, and a 100-GB EBS volume mapped to `/dev/sdf`. The EBS volume attached to the instance is encrypted using a customer managed KMS key.

For more information about block device mappings, see EbsBlockDevice and Modifying block device mappings during launch.

For more information, see Amazon EBS encryption.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-1a2b3c4d
&InstanceType=m6id.12xlarge
&BlockDeviceMapping.1.DeviceName=%2Fdev%2Fsdc
&BlockDeviceMapping.1.VirtualName=ephemeral0
&BlockDeviceMapping.2.DeviceName=%2Fdev%2Fsdd
&BlockDeviceMapping.2.VirtualName=ephemeral1
&BlockDeviceMapping.3.DeviceName=%2Fdev%2Fsdf
&BlockDeviceMapping.3.Ebs.DeleteOnTermination=false
&BlockDeviceMapping.3.Ebs.VolumeSize=100
&BlockDeviceMapping.3.Ebs.Encrypted=true
&BlockDeviceMapping.3.Ebs.KmsKeyId=arn%3Aaws%3Akms%3Aus-east-1%3A009400881653%3Akey
%2Fa48a521f-3aff-4b34-a159-376ac5d37812
&EbsOptimized=false
&MinCount=1
&MaxCount=1
&DisableApiTermination=false
&Monitoring.Enabled=false
&AUTHPARAMS
```

## Example 7

This request launches two instances and applies a tag with a key of `webserver` and a value of `production` to the instances. The request also applies a tag with a key of `cost-center` and a value of `cc123` to the volumes that are created (in this case, the root volume for each instance).

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-31814f58
&InstanceType=t2.large
&MaxCount=2
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
```

```
&SubnetId=subnet-b2a249da
&TagSpecification.1.ResourceType=instance
&TagSpecification.1.Tag.1.Key=webserver
&TagSpecification.1.Tag.1.Value=production
&TagSpecification.2.ResourceType=volume
&TagSpecification.2.Tag.1.Key=cost-center
&TagSpecification.2.Tag.1.Value=cc123
&AUTHPARAMS
```

## Example 8

This request launches a burstable performance instance with the credit option for CPU usage set to `unlimited`.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-31814f58
&InstanceType=t2.micro
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
&CreditSpecification.CpuCredits=unlimited
&AUTHPARAMS
```

## Example 9

This request launches an instance into the specified partition placement group but does not specify the partition.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-31814f58
&InstanceType=t3.large
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
&Placement=HDFS-Group-A
&AUTHPARAMS
```

## Example 10

This request launches an instance into the specified partition placement group and into the specified partition.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-31814f58
&InstanceType=t3.large
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
&Placement=HDFS-Group-A
&Partition=2
&AUTHPARAMS
```

## Example 11

This example launches an instance with a metadata type requiring a session token for metadata retrieval requests.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-1a2b3c4d
&InstanceType=c6i.large
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
&MetadataOptions.HttpTokens=required
&AUTHPARAMS
```

## Example 12

This example launches an instance with instance metadata access turned off.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-1a2b3c4d
```

```
&InstanceType=c6i.large
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
&MetadataOptions.HttpEndpoint=disabled
&AUTHPARAMS
```

## Example 13

This example launches an instance with a metadata type requiring a session token for metadata retrieval requests and a metadata hop limit of 3.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-1a2b3c4d
&InstanceType=c6i.large
&MaxCount=1
&MinCount=1
&KeyName=my-key-pair
&SecurityGroupId.1=sg-0598c7d3
&MetadataOptions.HttpTokens=required
&MetadataOptions.HttpPutResponseHopLimit=3
&AUTHPARAMS
```

## Example 14

This example launches an instance and assigns two security groups and an IPv6 address to the primary network interface.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
&ImageId=ami-00112233445566aab
&InstanceType=t2.micro
&MinCount=1
&MaxCount=1
&NetworkInterface.1.DeviceIndex=0
&NetworkInterface.1.SecurityGroupId.1=sg-444455556666cccdd
&NetworkInterface.1.SecurityGroupId.2=sg-111122223333aaabb
&NetworkInterface.1.Ipv6Addresses.1.Ipv6Address=2001:db8:1234:1a00::123
&NetworkInterface.1.SubnetId=subnet-aabbccdd112233445
```

```
&AUTHPARAMS
```

## Example 15

This example launches a single instance with 8 secondary interfaces, each on a separate network card and configured for automatic deletion on termination.

### Sample Request

```
https://ec2.amazonaws.com/?Action=RunInstances
  &ImageId=ami-beb0caec
  &InstanceType=<instanceType>
  &MaxCount=1
  &MinCount=1
  &Placement.AvailabilityZoneId=use2-az1
  &NetworkInterface.1.DeviceIndex=0
  &NetworkInterface.1.SubnetId=subnet-a61dafcf
  &NetworkInterface.1.DeleteOnTermination
  &SecondaryInterface.1.SecondarySubnetId=ss-073988ab526b59d2c
  &SecondaryInterface.1.NetworkCardIndex=1
  &SecondaryInterface.1.DeviceIndex=0
  &SecondaryInterface.1.InterfaceType=secondary
  &SecondaryInterface.1.DeleteOnTermination=true
  &SecondaryInterface.1.PrivateIpAddressCount=1
  &SecondaryInterface.2.SecondarySubnetId=ss-061ba0b5a43c9eabe
  &SecondaryInterface.2.NetworkCardIndex=2
  &SecondaryInterface.2.DeviceIndex=0
  &SecondaryInterface.2.InterfaceType=secondary
  &SecondaryInterface.2.DeleteOnTermination=true
  &SecondaryInterface.2.PrivateIpAddressCount=1
  &SecondaryInterface.3.SecondarySubnetId=ss-060c8c15859a0c8e5
  &SecondaryInterface.3.NetworkCardIndex=3
  &SecondaryInterface.3.DeviceIndex=0
  &SecondaryInterface.3.InterfaceType=secondary
  &SecondaryInterface.3.DeleteOnTermination=true
  &SecondaryInterface.3.PrivateIpAddressCount=1
  &SecondaryInterface.4.SecondarySubnetId=ss-0dafcecef369ae17d
  &SecondaryInterface.4.NetworkCardIndex=4
  &SecondaryInterface.4.DeviceIndex=0
  &SecondaryInterface.4.InterfaceType=secondary
  &SecondaryInterface.4.DeleteOnTermination=true
  &SecondaryInterface.4.PrivateIpAddressCount=1
  &SecondaryInterface.5.SecondarySubnetId=ss-073988ab526b59d2e
```

```
  &SecondaryInterface.5.NetworkCardIndex=5
  &SecondaryInterface.5.DeviceIndex=0
  &SecondaryInterface.5.InterfaceType=secondary
  &SecondaryInterface.5.DeleteOnTermination=true
  &SecondaryInterface.5.PrivateIpAddressCount=1
  &SecondaryInterface.6.SecondarySubnetId=ss-061ba0b5a43c9eabf
  &SecondaryInterface.6.NetworkCardIndex=6
  &SecondaryInterface.6.DeviceIndex=0
  &SecondaryInterface.6.InterfaceType=secondary
  &SecondaryInterface.6.DeleteOnTermination=true
  &SecondaryInterface.6.PrivateIpAddressCount=1
  &SecondaryInterface.7.SecondarySubnetId=ss-060c8c15859a0c8e1
  &SecondaryInterface.7.NetworkCardIndex=7
  &SecondaryInterface.7.DeviceIndex=0
  &SecondaryInterface.7.InterfaceType=secondary
  &SecondaryInterface.7.DeleteOnTermination=true
  &SecondaryInterface.7.PrivateIpAddressCount=1
  &SecondaryInterface.8.SecondarySubnetId=ss-0dafcecef369ae172
  &SecondaryInterface.8.NetworkCardIndex=8
  &SecondaryInterface.8.DeviceIndex=0
  &SecondaryInterface.8.InterfaceType=secondary
  &SecondaryInterface.8.DeleteOnTermination=true
  &SecondaryInterface.8.PrivateIpAddressCount=1
  &AUTHPARAMS
```

## Sample Response

```

# RunScheduledInstances

Launches the specified Scheduled Instances.

Before you can launch a Scheduled Instance, you must purchase it and obtain an identifier using PurchaseScheduledInstances.

You must launch a Scheduled Instance during its scheduled time period. You can't stop or reboot a Scheduled Instance, but you can terminate it as needed. If you terminate a Scheduled Instance before the current scheduled time period ends, you can launch it again after a few minutes.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

Unique, case-sensitive identifier that ensures the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceCount**

The number of instances.

Default: 1

Type: Integer

Required: No

**LaunchSpecification**

The launch specification. You must match the instance type, Availability Zone, network, and platform of the schedule that you purchased.

Type: ScheduledInstancesLaunchSpecification object

Required: Yes

**ScheduledInstanceId**

The Scheduled Instance ID.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**instanceIdSet**

The IDs of the newly launched instances.

Type: Array of strings

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

# SearchLocalGatewayRoutes

Searches for routes in the specified local gateway route table.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters.

- `prefix-list-id` - The ID of the prefix list.
- `route-search.exact-match` - The exact match of the specified filter.
- `route-search.longest-prefix-match` - The longest prefix that matches the route.
- `route-search.subnet-of-match` - The routes with a subnet that match the specified CIDR filter.
- `route-search.supernet-of-match` - The routes with a CIDR that encompass the CIDR filter. For example, if you have 10.0.1.0/29 and 10.0.1.0/31 routes in your route table and you specify `supernet-of-match` as 10.0.1.0/30, then the result returns 10.0.1.0/29.
- `state` - The state of the route.
- `type` - The route type.

Type: Array of Filter objects

Required: No

**LocalGatewayRouteTableId**

The ID of the local gateway route table.

Type: String

Required: Yes

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**routeSet**

Information about the routes.

Type: Array of LocalGatewayRoute objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# SearchTransitGatewayMulticastGroups

Searches one or more transit gateway multicast groups and returns the group membership information.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters. The possible values are:

- `group-ip-address` - The IP address of the transit gateway multicast group.
- `is-group-member` - The resource is a group member. Valid values are `true` | `false`.
- `is-group-source` - The resource is a group source. Valid values are `true` | `false`.
- `member-type` - The member type. Valid values are `igmp` | `static`.
- `resource-id` - The ID of the resource.
- `resource-type` - The type of resource. Valid values are `vpc` | `vpn` | `direct-connect-gateway` | `tgw-peering`.
- `source-type` - The source type. Valid values are `igmp` | `static`.
- `subnet-id` - The ID of the subnet.
- `transit-gateway-attachment-id` - The id of the transit gateway attachment.

Type: Array of Filter objects

Required: No

**MaxResults**

The maximum number of results to return with a single call. To retrieve the remaining results, make another call with the returned `nextToken` value.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**multicastGroups**

Information about the transit gateway multicast group.

Type: Array of TransitGatewayMulticastGroup objects

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example 1

This example returns the group membership information for the specified multicast domain.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=SearchTransitGatewayMulticastGroups
&TransitGatewayMulticastDomainId=tgw-mcast-domain-0c4905cef79d6e597
&AUTHPARAMS
```

#### Sample Response

```
<SearchTransitGatewayMulticastGroupsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>19af1e8f-f80b-479d-9cf4-c7d19EXAMPLE</requestId>
    <multicastGroups>
        <item>
            <groupIpAddress>224.0.1.0</groupIpAddress>
            <groupMember>true</groupMember>
            <groupSource>false</groupSource>
            <memberType>static</memberType>
            <networkInterfaceId>eni-07f290fc3cEXAMPLE</networkInterfaceId>
            <subnetId>subnet-000de86e3bEXAMPLE</subnetId>
            <transitGatewayAttachmentId>tgw-attach-028c1dd0f8EXAMPLE</
transitGatewayAttachmentId>
        </item>
        <item>
            <groupIpAddress>224.0.1.0</groupIpAddress>
            <groupMember>false</groupMember>
```

```
            <groupSource>true</groupSource>
            <networkInterfaceId>eni-0e246d32695012e81</networkInterfaceId>
            <sourceType>static</sourceType>
            <subnetId>subnet-000de86e3bEXAMPLE</subnetId>
            <transitGatewayAttachmentId>tgw-attach-028c1dd0f8EXAMPLE</
transitGatewayAttachmentId>
        </item>
    </multicastGroups>
</SearchTransitGatewayMulticastGroupsResponse>
```

# SearchTransitGatewayRoutes

Searches for routes in the specified transit gateway route table.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Filter.N**

One or more filters. The possible values are:

- `attachment.transit-gateway-attachment-id`- The id of the transit gateway attachment.
- `attachment.resource-id` - The resource id of the transit gateway attachment.
- `attachment.resource-type` - The attachment resource type. Valid values are `vpc` | `vpn` | `direct-connect-gateway` | `peering` | `connect`.
- `prefix-list-id` - The ID of the prefix list.
- `route-search.exact-match` - The exact match of the specified filter.
- `route-search.longest-prefix-match` - The longest prefix that matches the route.
- `route-search.subnet-of-match` - The routes with a subnet that match the specified CIDR filter.
- `route-search.supernet-of-match` - The routes with a CIDR that encompass the CIDR filter. For example, if you have 10.0.1.0/29 and 10.0.1.0/31 routes in your route table and you specify supernet-of-match as 10.0.1.0/30, then the result returns 10.0.1.0/29.
- `state` - The state of the route (`active` | `blackhole`).
- `type` - The type of route (`propagated` | `static`).

Type: Array of Filter objects

Required: Yes

**MaxResults**

The maximum number of routes to return. If a value is not provided, the default is 1000.

Type: Integer

Valid Range: Minimum value of 5. Maximum value of 1000.

Required: No

**NextToken**

The token for the next page of results.

Type: String

Required: No

**TransitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**additionalRoutesAvailable**

Indicates whether there are additional routes available.

Type: Boolean

**nextToken**

The token to use to retrieve the next page of results. This value is `null` when there are no more results to return.

Type: String

**requestId**

The ID of the request.

Type: String

**routeSet**

Information about the routes.

Type: Array of TransitGatewayRoute objects

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# SendDiagnosticInterrupt

Sends a diagnostic interrupt to the specified Amazon EC2 instance to trigger a *kernel panic* (on Linux instances), or a *blue screen/stop error* (on Windows instances). For instances based on Intel and AMD processors, the interrupt is received as a *non-maskable interrupt* (NMI).

In general, the operating system crashes and reboots when a kernel panic or stop error is triggered. The operating system can also be configured to perform diagnostic tasks, such as generating a memory dump file, loading a secondary kernel, or obtaining a call trace.

Before sending a diagnostic interrupt to your instance, ensure that its operating system is configured to perform the required diagnostic tasks.

For more information about configuring your operating system to generate a crash dump when a kernel panic or stop error occurs, see Send a diagnostic interrupt (for advanced users) in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId**

The ID of the instance.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example sends a diagnostic interrupt to the specified instance.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=SendDiagnosticInterrupt
&InstanceId=i-1234567890abcdef0
&AUTHPARAMS
```

#### Sample Response

```
<SendDiagnosticInterruptResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <return>true</return>
</SendDiagnosticInterruptResponse>
```

# StartDeclarativePoliciesReport

Generates an account status report. The report is generated asynchronously, and can take several hours to complete.

The report provides the current status of all attributes supported by declarative policies for the accounts within the specified scope. The scope is determined by the specified `TargetId`, which can represent an individual account, or all the accounts that fall under the specified organizational unit (OU) or root (the entire AWS Organization).

The report is saved to your specified S3 bucket, using the following path structure (with the capitalized placeholders representing your specific values):

```
s3://AMZN-S3-DEMO-BUCKET/YOUR-OPTIONAL-S3-PREFIX/
ec2_TARGETID_REPORTID_YYYYMMDDTHHMMZ.csv
```

**Prerequisites for generating a report**

- The `StartDeclarativePoliciesReport` API can only be called by the management account or delegated administrators for the organization.
- An S3 bucket must be available before generating the report (you can create a new one or use an existing one), it must be in the same Region where the report generation request is made, and it must have an appropriate bucket policy. For a sample S3 policy, see *Sample Amazon S3 policy* under Examples.
- Trusted access must be enabled for the service for which the declarative policy will enforce a baseline configuration. If you use the AWS Organizations console, this is done automatically when you enable declarative policies. The API uses the following service principal to identify the EC2 service: `ec2.amazonaws.com`. For more information on how to enable trusted access with the AWS CLI and AWS SDKs, see Using Organizations with other AWS services in the *AWS Organizations User Guide*.
- Only one report per organization can be generated at a time. Attempting to generate a report while another is in progress will result in an error.

For more information, including the required IAM permissions to run this API, see Generating the account status report for declarative policies in the *AWS Organizations User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**S3Bucket**

The name of the S3 bucket where the report will be saved. The bucket must be in the same Region where the report generation request is made.

Type: String

Required: Yes

**S3Prefix**

The prefix for your S3 object.

Type: String

Required: No

**TagSpecification.N**

The tags to apply.

Type: Array of TagSpecification objects

Required: No

**TargetId**

The root ID, organizational unit ID, or account ID.

Format:

- For root: `r-ab12`
- For OU: `ou-ab12-cdef1234`
- For account: `123456789012`

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**reportId**

The ID of the report.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Sample Amazon S3 policy

Before generating a report, you must grant the EC2 Declarative Policies principal access to the Amazon S3 bucket where the report will be stored. To do this, attach the following policy to the bucket. Remember to replace *amzn-s3-demo-bucket* in the policy with your actual S3 bucket name, and *identity_ARN* with the IAM identity used to call the `StartDeclarativePoliciesReport` API. The statement in the `Condition` element ensures that the service can call the operation on your behalf using the credentials used to call the `StartDeclarativePoliciesReport` API.

```
{
```

```
    "Version": "2012-10-17",
    "Statement": [{
        "Sid": "DeclarativePoliciesReportDelivery",
        "Effect": "Allow",
        "Principal": {
            "AWS": "identity_ARN"
        },
        "Action": [
            "s3:PutObject"
        ],
        "Resource": "arn:aws:s3:::amzn-s3-demo-bucket/*",
        "Condition": {
            "StringEquals": {
                "aws:CalledViaLast": "report.declarative-policies-ec2.amazonaws.com"
            }
        }
    }]
}
```

# StartInstances

Starts an Amazon EBS-backed instance that you've previously stopped.

Instances that use Amazon EBS volumes as their root devices can be quickly stopped and started. When an instance is stopped, the compute resources are released and you are not billed for instance usage. However, your root partition Amazon EBS volume remains and continues to persist your data, and you are charged for Amazon EBS volume usage. You can restart your instance at any time. Every time you start your instance, Amazon EC2 charges a one-minute minimum for instance usage, and thereafter charges per second for instance usage.

Before stopping an instance, make sure it is in a state from which it can be restarted. Stopping an instance does not preserve data stored in RAM.

Performing this operation on an instance that uses an instance store as its root device returns an error.

If you attempt to start a T3 instance with `host` tenancy and the `unlimited` CPU credit option, the request fails. The `unlimited` CPU credit option is not supported on Dedicated Hosts. Before you start the instance, either change its CPU credit option to `standard`, or change its tenancy to `default` or `dedicated`.

For more information, see Stop and start Amazon EC2 instances in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AdditionalInfo**

Reserved.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId.N**

The IDs of the instances.

Type: Array of strings

Required: Yes

## Response Elements

The following elements are returned by the service.

**instancesSet**

Information about the started instances.

Type: Array of InstanceStateChange objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example starts the specified instance.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=StartInstances
&InstanceId.1=i-1234567890abcdef0
```

```
&AUTHPARAMS
```

### Sample Response

```
<StartInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instancesSet>
    <item>
      <instanceId>i-1234567890abcdef0</instanceId>
      <currentState>
          <code>0</code>
          <name>pending</name>
      </currentState>
      <previousState>
          <code>80</code>
          <name>stopped</name>
      </previousState>
    </item>
  </instancesSet>
</StartInstancesResponse>
```

# StartNetworkInsightsAccessScopeAnalysis

Starts analyzing the specified Network Access Scope.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**NetworkInsightsAccessScopeId**

The ID of the Network Access Scope.

Type: String

Required: Yes

**TagSpecification.N**

The tags to apply.

Type: Array of TagSpecification objects

Required: No

## Response Elements

The following elements are returned by the service.

**networkInsightsAccessScopeAnalysis**

The Network Access Scope analysis.

Type: NetworkInsightsAccessScopeAnalysis object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Python
- AWS SDK for Ruby V3

# StartNetworkInsightsAnalysis

Starts analyzing the specified path. If the path is reachable, the operation returns the shortest feasible path.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**AdditionalAccount.N**

The member accounts that contain resources that the path can traverse.

Type: Array of strings

Required: No

**ClientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see How to ensure idempotency.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**FilterInArn.N**

The Amazon Resource Names (ARN) of the resources that the path must traverse.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**FilterOutArn.N**

The Amazon Resource Names (ARN) of the resources that the path will ignore.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**NetworkInsightsPathId**

The ID of the path.

Type: String

Required: Yes

**TagSpecification.N**

The tags to apply.

Type: Array of TagSpecification objects

Required: No

## Response Elements

The following elements are returned by the service.

**networkInsightsAnalysis**

Information about the network insights analysis.

Type: NetworkInsightsAnalysis object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# StartVpcEndpointServicePrivateDnsVerification

Initiates the verification process to prove that the service provider owns the private DNS name domain for the endpoint service.

The service provider must successfully perform the verification before the consumer can use the name to access the service.

Before the service provider runs this command, they must add a record to the DNS server.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**ServiceId**

The ID of the endpoint service.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, it returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# StopInstances

Stops an Amazon EBS-backed instance. You can restart your instance at any time using the StartInstances API. For more information, see Stop and start Amazon EC2 instances in the *Amazon EC2 User Guide*.

When you stop or hibernate an instance, we shut it down. By default, this includes a graceful operating system (OS) shutdown. To bypass the graceful shutdown, use the `skipOsShutdown` parameter; however, this might risk data integrity.

You can use the StopInstances operation together with the `Hibernate` parameter to hibernate an instance if the instance is enabled for hibernation and meets the hibernation prerequisites. Stopping an instance doesn't preserve data stored in RAM, while hibernation does. If hibernation fails, a normal shutdown occurs. For more information, see Hibernate your Amazon EC2 instance in the *Amazon EC2 User Guide*.

If your instance appears stuck in the `stopping` state, there might be an issue with the underlying host computer. You can use the StopInstances operation together with the Force parameter to force stop your instance. For more information, see Troubleshoot Amazon EC2 instance stop issues in the *Amazon EC2 User Guide*.

Stopping and hibernating an instance differs from rebooting or terminating it. For example, a stopped or hibernated instance retains its root volume and any data volumes, unlike terminated instances where these volumes are automatically deleted. For more information about the differences between stopping, hibernating, rebooting, and terminating instances, see Amazon EC2 instance state changes in the *Amazon EC2 User Guide*.

We don't charge for instance usage or data transfer fees when an instance is stopped. However, the root volume and any data volumes remain and continue to persist your data, and you're charged for volume usage. Every time you start your instance, Amazon EC2 charges a one-minute minimum for instance usage, followed by per-second billing.

You can't stop or hibernate instance store-backed instances.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Force**

Forces the instance to stop. The instance will first attempt a graceful shutdown, which includes flushing file system caches and metadata. If the graceful shutdown fails to complete within the timeout period, the instance shuts down forcibly without flushing the file system caches and metadata.

After using this option, you must perform file system check and repair procedures. This option is not recommended for Windows instances. For more information, see Troubleshoot Amazon EC2 instance stop issues in the *Amazon EC2 User Guide*.

Default: `false`

Type: Boolean

Required: No

**Hibernate**

Hibernates the instance if the instance was enabled for hibernation at launch. If the instance cannot hibernate successfully, a normal shutdown occurs. For more information, see Hibernate your Amazon EC2 instance in the *Amazon EC2 User Guide*.

Default: `false`

Type: Boolean

Required: No

**InstanceId.N**

The IDs of the instances.

Type: Array of strings

Required: Yes

**SkipOsShutdown**

Specifies whether to bypass the graceful OS shutdown process when the instance is stopped.

> **Important**
>
> Bypassing the graceful OS shutdown might result in data loss or corruption (for example, memory contents not flushed to disk or loss of in-flight IOs) or skipped shutdown scripts.

Default: `false`

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**instancesSet**

Information about the stopped instances.

Type: Array of InstanceStateChange objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example stops the specified instance.

### Sample Request

```
https://ec2.amazonaws.com/?Action=StopInstances
&InstanceId.1=i-1234567890abcdef0
&AUTHPARAMS
```

### Sample Response

```
<StopInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instancesSet>
    <item>
      <instanceId>i-1234567890abcdef0</instanceId>
      <currentState>
          <code>64</code>
          <name>stopping</name>
      </currentState>
      <previousState>
          <code>16</code>
          <name>running</name>
      </previousState>
    </item>
  </instancesSet>
</StopInstancesResponse>
```

# TerminateClientVpnConnections

Terminates active Client VPN endpoint connections. This action can be used to terminate a specific client connection, or up to five connections established by a specific user.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientVpnEndpointId**

The ID of the Client VPN endpoint to which the client is connected.

Type: String

Required: Yes

**ConnectionId**

The ID of the client connection to be terminated.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Username**

The name of the user who initiated the connection. Use this option to terminate all active connections for the specified user. This option can only be used if the user has established up to five connections.

Type: String

Required: No

## Response Elements

The following elements are returned by the service.

**clientVpnEndpointId**

The ID of the Client VPN endpoint.

Type: String

**connectionStatuses**

The current state of the client connections.

Type: Array of TerminateConnectionStatus objects

**requestId**

The ID of the request.

Type: String

**username**

The user who established the terminated client connections.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example terminates a Client VPN endpoint connection.

**Sample Request**

```
https://ec2.amazonaws.com/?Action=TerminateClientVpnConnections
```

```
&ClientVpnEndpointId=cvpn-endpoint-00c5d11fc4EXAMPLE
&ConnectionId=cvpn-connection-010b1282b7EXAMPLE
&AUTHPARAMS
```

### Sample Response

```
<TerminateClientVpnConnectionsResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
 <clientVpnEndpointId>cvpn-endpoint-00c5d11fc4EXAMPLE</clientVpnEndpointId>
 <connectionStatuses>
  <Item>
   <connectionId>cvpn-connection-010b1282b7EXAMPLE</connectionId>
         <currentStatus>
    <code>terminating</code>
         </currentStatus>
         <previousStatus>
          <code>active</code>
         </previousStatus>
        </Item>
    </connectionStatuses>
 <requestId>00d80748-708d-40f7-8635-f34acEXAMPLE</requestId>
</TerminateClientVpnConnectionsResponse>
```

# TerminateInstances

Terminates (deletes) the specified instances. This operation is idempotent; if you terminate an instance more than once, each call succeeds.

> **Important**
>
> **Terminating an instance is permanent and irreversible.**
> After you terminate an instance, you can no longer connect to it, and it can't be recovered. All attached Amazon EBS volumes that are configured to be deleted on termination are also permanently deleted and can't be recovered. All data stored on instance store volumes is permanently lost. For more information, see How instance termination works.
> Before you terminate an instance, ensure that you have backed up all data that you need to retain after the termination to persistent storage.

If you specify multiple instances and the request fails (for example, because of a single incorrect instance ID), none of the instances are terminated.

If you terminate multiple instances across multiple Availability Zones, and one or more of the specified instances are enabled for termination protection, the request fails with the following results:

- The specified instances that are in the same Availability Zone as the protected instance are not terminated.
- The specified instances that are in different Availability Zones, where no other specified instances are protected, are successfully terminated.

For example, say you have the following instances:

- Instance A: `us-east-1a`; Not protected
- Instance B: `us-east-1a`; Not protected
- Instance C: `us-east-1b`; Protected
- Instance D: `us-east-1b`; not protected

If you attempt to terminate all of these instances in the same request, the request reports failure with the following results:

- Instance A and Instance B are successfully terminated because none of the specified instances in `us-east-1a` are enabled for termination protection.
- Instance C and Instance D fail to terminate because at least one of the specified instances in `us-east-1b` (Instance C) is enabled for termination protection.

Terminated instances remain visible after termination (for approximately one hour).

By default, Amazon EC2 deletes all EBS volumes that were attached when the instance launched. Volumes attached after instance launch continue running.

By default, the TerminateInstances operation includes a graceful operating system (OS) shutdown. To bypass the graceful shutdown, use the `skipOsShutdown` parameter; however, this might risk data integrity.

You can stop, start, and terminate EBS-backed instances. You can only terminate instance store-backed instances. What happens to an instance differs if you stop or terminate it. For example, when you stop an instance, the root device and any other devices attached to the instance persist. When you terminate an instance, any attached EBS volumes with the `DeleteOnTermination` block device mapping parameter set to `true` are automatically deleted. For more information about the differences between stopping and terminating instances, see Amazon EC2 instance state changes in the *Amazon EC2 User Guide*.

When you terminate an instance, we attempt to terminate it forcibly after a short while. If your instance appears stuck in the shutting-down state after a period of time, there might be an issue with the underlying host computer. For more information about terminating and troubleshooting terminating your instances, see Terminate Amazon EC2 instances and Troubleshooting terminating your instance in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**Force**

Forces the instances to terminate. The instance will first attempt a graceful shutdown, which includes flushing file system caches and metadata. If the graceful shutdown fails to complete within the timeout period, the instance shuts down forcibly without flushing the file system caches and metadata.

Type: Boolean

Required: No

**InstanceId.N**

The IDs of the instances.

Constraints: Up to 1000 instance IDs. We recommend breaking up this request into smaller batches.

Type: Array of strings

Required: Yes

**SkipOsShutdown**

Specifies whether to bypass the graceful OS shutdown process when the instance is terminated.

Default: `false`

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**instancesSet**

Information about the terminated instances.

Type: Array of InstanceStateChange objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example terminates the specified instance.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=TerminateInstances
&InstanceId.1=i-1234567890abcdef0
&AUTHPARAMS
```

#### Sample Response

```
<TerminateInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
  <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
  <instancesSet>
    <item>
      <instanceId>i-1234567890abcdef0</instanceId>
      <currentState>
        <code>32</code>
        <name>shutting-down</name>
      </currentState>
      <previousState>
        <code>16</code>
        <name>running</name>
      </previousState>
    </item>
  </instancesSet>
</TerminateInstancesResponse>
```

# UnassignIpv6Addresses

Unassigns the specified IPv6 addresses or Prefix Delegation prefixes from a network interface.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Ipv6Addresses.N**

The IPv6 addresses to unassign from the network interface.

Type: Array of strings

Required: No

**Ipv6Prefix.N**

The IPv6 prefixes to unassign from the network interface.

Type: Array of strings

Required: No

**NetworkInterfaceId**

The ID of the network interface.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**networkInterfaceId**

The ID of the network interface.

Type: String

**requestId**

The ID of the request.

Type: String

**unassignedIpv6Addresses**

The IPv6 addresses that have been unassigned from the network interface.

Type: Array of strings

**unassignedIpv6PrefixSet**

The IPv6 prefixes that have been unassigned from the network interface.

Type: Array of strings

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

The following example unassigns two IPv6 addresses from the specified network interface.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=UnassignIpv6Addresses
&NetworkInterfaceId=eni-197d9972
&Ipv6Addresses.1=2001:db8:1234:1a00::123
&Ipv6Addresses.2=2001:db8:1234:1a00::456
&AUTHPARAMS
```

#### Sample Response

```
<UnassignIpv6AddressesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
    <requestId>94d446d7-fc8e-4918-94f9-example</requestId>
    <networkInterfaceId>eni-197d9972</networkInterfaceId>
    <unassignedIpv6Addresses>
```

```
        <item>2001:db8:1234:1a00::123</item>
        <item>2001:db8:1234:1a00::456</item>
    </unassignedIpv6Addresses>
</UnassignIpv6AddressesResponse>
```

# UnassignPrivateIpAddresses

Unassigns the specified secondary private IP addresses or IPv4 Prefix Delegation prefixes from a network interface.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Ipv4Prefix.N**

The IPv4 prefixes to unassign from the network interface.

Type: Array of strings

Required: No

**NetworkInterfaceId**

The ID of the network interface.

Type: String

Required: Yes

**PrivateIpAddress.N**

The secondary private IP addresses to unassign from the network interface. You can specify this option multiple times to unassign more than one IP address.

Type: Array of strings

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Is `true` if the request succeeds, and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

The following example unassigns two secondary private IP addresses from the specified network interface.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=UnassignPrivateIpAddresses
&NetworkInterfaceId=eni-197d9972
&PrivateIpAddress.1=10.0.2.60
&PrivateIpAddress.2=10.0.2.65
&AUTHPARAMS
```

#### Sample Response

```
<UnassignPrivateIpAddresses xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <return>true</return>
</UnassignPrivateIpAddresses>
```

# UnassignPrivateNatGatewayAddress

Unassigns secondary private IPv4 addresses from a private NAT gateway. You cannot unassign your primary private IP. For more information, see Edit secondary IP address associations in the *Amazon VPC User Guide*.

While unassigning is in progress, you cannot assign/unassign additional IP addresses while the connections are being drained. You are, however, allowed to delete the NAT gateway.

A private IP address will only be released at the end of MaxDrainDurationSeconds. The private IP addresses stay associated and support the existing connections, but do not support any new connections (new connections are distributed across the remaining assigned private IP address). After the existing connections drain out, the private IP addresses are released.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**MaxDrainDurationSeconds**

The maximum amount of time to wait (in seconds) before forcibly releasing the IP addresses if connections are still in progress. Default value is 350 seconds.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 4000.

Required: No

**NatGatewayId**

The ID of the NAT gateway.

Type: String

Required: Yes

**PrivateIpAddress.N**

The private IPv4 addresses you want to unassign.

Type: Array of strings

Required: Yes

## Response Elements

The following elements are returned by the service.

**natGatewayAddressSet**

Information about the NAT gateway IP addresses.

Type: Array of NatGatewayAddress objects

**natGatewayId**

The ID of the NAT gateway.

Type: String

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# UnlockSnapshot

Unlocks a snapshot that is locked in governance mode or that is locked in compliance mode but still in the cooling-off period. You can't unlock a snapshot that is locked in compliance mode after the cooling-off period has expired.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**SnapshotId**

The ID of the snapshot to unlock.

Type: String

Required: Yes

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**snapshotId**

The ID of the snapshot.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# UnmonitorInstances

Disables detailed monitoring for a running instance. For more information, see Monitoring your instances and volumes in the *Amazon EC2 User Guide*.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the operation, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**InstanceId.N**

The IDs of the instances.

Type: Array of strings

Required: Yes

## Response Elements

The following elements are returned by the service.

**instancesSet**

The monitoring information.

Type: Array of InstanceMonitoring objects

**requestId**

The ID of the request.

Type: String

# Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example

This example disables detailed monitoring for the specified instances.

### Sample Request

```
https://ec2.amazonaws.com/?Action=UnmonitorInstances
&InstanceId.1=i-1234567890abcdef0
&InstanceId.2=i-0598c7d356eba48d7
&AUTHPARAMS
```

### Sample Response

```
<UnmonitorInstancesResponse xmlns="http://ec2.amazonaws.com/doc/2016-11-15/">
   <requestId>59dbff89-35bd-4eac-99ed-be587EXAMPLE</requestId>
   <instancesSet>
      <item>
         <instanceId>i-1234567890abcdef0</instanceId>
         <monitoring>
            <state>disabled</state>
         </monitoring>
      </item>
      <item>
         <instanceId>i-0598c7d356eba48d7</instanceId>
         <monitoring>

# UpdateCapacityManagerMonitoredTagKeys

Activates or deactivates tag keys for monitoring by EC2 Capacity Manager. Activated tag keys are included as dimensions in capacity metric data, enabling you to group and filter metrics by tag values.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ActivateTagKey.N**

The tag keys to activate for monitoring. Once activated, these tag keys will be included as dimensions in capacity metric data.

Type: Array of strings

Required: No

**ClientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

Required: No

**DeactivateTagKey.N**

The tag keys to deactivate. Deactivated tag keys will no longer be included as dimensions in capacity metric data.

Type: Array of strings

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**capacityManagerTagKeySet**

The list of tag keys affected by the update, including their current status and metadata.

Type: Array of CapacityManagerMonitoredTagKey objects

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example activates the `Environment` and `CostCenter` tag keys for monitoring, and deactivates the `Team` tag key.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=UpdateCapacityManagerMonitoredTagKeys
&ActivateTagKey.1=Environment
&ActivateTagKey.2=CostCenter
&DeactivateTagKey.1=Team
&AUTHPARAMS
```

#### Sample Response

```
<UpdateCapacityManagerMonitoredTagKeysResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
```

```
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
    <capacityManagerTagKeySet>
        <item>
            <tagKey>Environment</tagKey>
            <status>activating</status>
            <statusMessage/>
            <capacityManagerProvided>false</capacityManagerProvided>
        </item>
        <item>
            <tagKey>CostCenter</tagKey>
            <status>activating</status>
            <statusMessage/>
            <capacityManagerProvided>false</capacityManagerProvided>
        </item>
        <item>
            <tagKey>Team</tagKey>
            <status>deactivating</status>
            <statusMessage/>
            <capacityManagerProvided>false</capacityManagerProvided>
        </item>
    </capacityManagerTagKeySet>
</UpdateCapacityManagerMonitoredTagKeysResponse>
```

# UpdateCapacityManagerOrganizationsAccess

Updates the Organizations access setting for EC2 Capacity Manager. This controls whether Capacity Manager can aggregate data from all accounts in your AWS Organization or only from the current account.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**ClientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request.

Type: String

Required: No

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**OrganizationsAccess**

Specifies whether to enable or disable cross-account access for AWS Organizations. When enabled, Capacity Manager aggregates data from all accounts in your organization.

Type: Boolean

Required: Yes

## Response Elements

The following elements are returned by the service.

**capacityManagerStatus**

The current status of Capacity Manager after the update operation.

Type: String

Valid Values: `enabled | disabled`

**organizationsAccess**

The updated Organizations access setting indicating whether cross-account data aggregation is enabled.

Type: Boolean

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example enables Organizations access for cross-account data aggregation.

#### Sample Request

```
https://ec2.amazonaws.com/?Action=UpdateCapacityManagerOrganizationsAccess
&OrganizationsAccess=true
&AUTHPARAMS
```

#### Sample Response

```
<UpdateCapacityManagerOrganizationsAccessResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>d4904fd9-82c2-4ea5-adfe-a9cc3EXAMPLE</requestId>
```

```
    <capacityManagerStatus>enabled</capacityManagerStatus>
    <organizationsAccess>true</organizationsAccess>
</UpdateCapacityManagerOrganizationsAccessResponse>
```

# UpdateInterruptibleCapacityReservationAllocation

Modifies the number of instances allocated to an interruptible reservation, allowing you to add more capacity or reclaim capacity to your source Capacity Reservation.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**CapacityReservationId**

The ID of the source Capacity Reservation containing the interruptible allocation to modify.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response.

Type: Boolean

Required: No

**TargetInstanceCount**

The new number of instances to allocate. Enter a higher number to add more capacity to share, or a lower number to reclaim capacity to your source Capacity Reservation.

Type: Integer

Required: Yes

## Response Elements

The following elements are returned by the service.

**instanceCount**

The current number of instances allocated to the interruptible reservation.

Type: Integer

**interruptibleCapacityReservationId**

The ID of the interruptible Capacity Reservation that was modified.

Type: String

**interruptionType**

The interruption type for the interruptible reservation.

Type: String

Valid Values: adhoc

**requestId**

The ID of the request.

Type: String

**sourceCapacityReservationId**

The ID of the source Capacity Reservation to which capacity was reclaimed or from which capacity was allocated.

Type: String

**status**

The current status of the allocation (updating during reclamation, active when complete).

Type: String

Valid Values: `pending | active | updating | canceling | canceled | failed`

**targetInstanceCount**

The requested number of instances for the interruptible Capacity Reservation.

Type: Integer

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# UpdateSecurityGroupRuleDescriptionsEgress

Updates the description of an egress (outbound) security group rule. You can replace an existing description, or add a description to a rule that did not have one previously. You can remove a description for a security group rule by omitting the description parameter in the request.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**GroupId**

The ID of the security group. You must specify either the security group ID or the security group name in the request. For security groups in a nondefault VPC, you must specify the security group ID.

Type: String

Required: No

**GroupName**

[Default VPC] The name of the security group. You must specify either the security group ID or the security group name.

Type: String

Required: No

**IpPermissions.N**

The IP permissions for the security group rule. You must specify either the IP permissions or the description.

Type: Array of IpPermission objects

Required: No

**SecurityGroupRuleDescription.N**

The description for the egress security group rules. You must specify either the description or the IP permissions.

Type: Array of SecurityGroupRuleDescription objects

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

## Examples

### Example

This example updates the description for the security group rule that allows outbound access over port 80 to the `205.192.0.0/16` IPv4 address range. The description '`Outbound HTTP access to server 2`' replaces any existing description for the rule.

### Sample Request

```
https://ec2.amazonaws.com/?Action=UpdateSecurityGroupRuleDescriptionsEgress
&GroupId=sg-112233
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=80
&IpPermissions.1.ToPort=80
&IpPermissions.1.IpRanges.1.CidrIp=205.192.0.0/16
&IpPermissions.1.IpRanges.1.Description=Outbound HTTP access to server 2
&AUTHPARAMS
```

### Sample Response

```
<UpdateSecurityGroupRuleDescriptionsEgressResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>1480cf25-4fbe-4168-aa9c-365example</requestId>
    <return>true</return>
</UpdateSecurityGroupRuleDescriptionsEgressResponse>
```

# UpdateSecurityGroupRuleDescriptionsIngress

Updates the description of an ingress (inbound) security group rule. You can replace an existing description, or add a description to a rule that did not have one previously. You can remove a description for a security group rule by omitting the description parameter in the request.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

**GroupId**

The ID of the security group. You must specify either the security group ID or the security group name in the request. For security groups in a nondefault VPC, you must specify the security group ID.

Type: String

Required: No

**GroupName**

[Default VPC] The name of the security group. You must specify either the security group ID or the security group name. For security groups in a nondefault VPC, you must specify the security group ID.

Type: String

Required: No

**IpPermissions.N**

The IP permissions for the security group rule. You must specify either IP permissions or a description.

Type: Array of IpPermission objects

Required: No

**SecurityGroupRuleDescription.N**

The description for the ingress security group rules. You must specify either a description or IP permissions.

Type: Array of SecurityGroupRuleDescription objects

Required: No

## Response Elements

The following elements are returned by the service.

**requestId**

The ID of the request.

Type: String

**return**

Returns `true` if the request succeeds; otherwise, returns an error.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Examples

## Example 1

This example updates the description for the security group rule that allows inbound access over port 22 from the `203.0.113.0/16` IPv4 address range. The description '`SSH access from ABC office`' replaces any existing description for the rule.

### Sample Request

```
https://ec2.amazonaws.com/?Action=UpdateSecurityGroupRuleDescriptionsIngress
&GroupId=sg-112233
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=22
&IpPermissions.1.ToPort=22
&IpPermissions.1.IpRanges.1.CidrIp=203.0.113.0/16
&IpPermissions.1.IpRanges.1.Description=SSH access from ABC office
&AUTHPARAMS
```

### Sample Response

```
<UpdateSecurityGroupRuleDescriptionsIngressResponse xmlns="http://ec2.amazonaws.com/
doc/2016-11-15/">
    <requestId>b4a57536-2e4a-4cbe-82f0-399example</requestId>
    <return>true</return>
</UpdateSecurityGroupRuleDescriptionsIngressResponse>
```

## Example 2

This example removes the description for the specified security group rule.

### Sample Request

```
https://ec2.amazonaws.com/?Action=UpdateSecurityGroupRuleDescriptionsIngress
&GroupId=sg-112233
&IpPermissions.1.IpProtocol=tcp
&IpPermissions.1.FromPort=22
&IpPermissions.1.ToPort=22
&IpPermissions.1.IpRanges.1.CidrIp=203.0.113.4/32
&AUTHPARAMS
```

# WithdrawByoipCidr

Stops advertising an address range that is provisioned as an address pool.

You can perform this operation at most once every 10 seconds, even if you specify different address ranges each time.

It can take a few minutes before traffic to the specified addresses stops routing to AWS because of BGP propagation delays.

## Request Parameters

The following parameters are for this specific action. For more information about required and optional parameters that are common to all actions, see Common Query Parameters.

**Cidr**

The address range, in CIDR notation.

Type: String

Required: Yes

**DryRun**

Checks whether you have the required permissions for the action, without actually making the request, and provides an error response. If you have the required permissions, the error response is `DryRunOperation`. Otherwise, it is `UnauthorizedOperation`.

Type: Boolean

Required: No

## Response Elements

The following elements are returned by the service.

**byoipCidr**

Information about the address pool.

Type: ByoipCidr object

**requestId**

The ID of the request.

Type: String

## Errors

For information about the errors that are common to all actions, see Common Error Types.

# Data Types

The Amazon Elastic Compute Cloud API contains several data types that various actions use. This section describes each data type in detail.

> **Note**
>
> The order of each element in a data type structure is not guaranteed. Applications should not assume a particular order.

The following data types are supported:

- AcceleratorCount
- AcceleratorCountRequest
- AcceleratorTotalMemoryMiB
- AcceleratorTotalMemoryMiBRequest
- AccessScopeAnalysisFinding
- AccessScopePath
- AccessScopePathRequest
- AccountAttribute
- AccountAttributeValue
- ActiveInstance
- ActiveVpnTunnelStatus
- AddedPrincipal
- AddIpamOperatingRegion
- AddIpamOrganizationalUnitExclusion

# AcceleratorCount

The minimum and maximum number of accelerators (GPUs, FPGAs, or AWS Inferentia chips) on an instance.

## Contents

**Max** (request), **max** (response)

The maximum number of accelerators. If this parameter is not specified, there is no maximum limit.

Type: Integer

Required: No

**Min** (request), **min** (response)

The minimum number of accelerators. If this parameter is not specified, there is no minimum limit.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AcceleratorCountRequest

The minimum and maximum number of accelerators (GPUs, FPGAs, or AWS Inferentia chips) on an instance. To exclude accelerator-enabled instance types, set `Max` to `0`.

## Contents

**Max**

The maximum number of accelerators. To specify no maximum limit, omit this parameter. To exclude accelerator-enabled instance types, set `Max` to `0`.

Type: Integer

Required: No

**Min**

The minimum number of accelerators. To specify no minimum limit, omit this parameter.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AcceleratorTotalMemoryMiB

The minimum and maximum amount of total accelerator memory, in MiB.

## Contents

**Max** (request), **max** (response)

The maximum amount of accelerator memory, in MiB. If this parameter is not specified, there is no maximum limit.

Type: Integer

Required: No

**Min** (request), **min** (response)

The minimum amount of accelerator memory, in MiB. If this parameter is not specified, there is no minimum limit.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AcceleratorTotalMemoryMiBRequest

The minimum and maximum amount of total accelerator memory, in MiB.

## Contents

**Max**

The maximum amount of accelerator memory, in MiB. To specify no maximum limit, omit this parameter.

Type: Integer

Required: No

**Min**

The minimum amount of accelerator memory, in MiB. To specify no minimum limit, omit this parameter.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AccessScopeAnalysisFinding

Describes a finding for a Network Access Scope.

## Contents

**FindingComponentSet.N**

The finding components.

Type: Array of PathComponent objects

Required: No

**findingId**

The ID of the finding.

Type: String

Required: No

**networkInsightsAccessScopeAnalysisId**

The ID of the Network Access Scope analysis.

Type: String

Required: No

**networkInsightsAccessScopeId**

The ID of the Network Access Scope.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AccessScopePath

Describes a path.

## Contents

**destination**

The destination.

Type: PathStatement object

Required: No

**source**

The source.

Type: PathStatement object

Required: No

**ThroughResourceSet.N**

The through resources.

Type: Array of ThroughResourcesStatement objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AccessScopePathRequest

Describes a path.

## Contents

**Destination**

The destination.

Type: PathStatementRequest object

Required: No

**Source**

The source.

Type: PathStatementRequest object

Required: No

**ThroughResource.N**

The through resources.

Type: Array of ThroughResourcesStatementRequest objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AccountAttribute

Describes an account attribute.

## Contents

**attributeName**

The name of the account attribute.

Type: String

Required: No

**AttributeValueSet.N**

The values for the account attribute.

Type: Array of AccountAttributeValue objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AccountAttributeValue

Describes a value of an account attribute.

## Contents

**attributeValue**

The value of the attribute.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ActiveInstance

Describes a running instance in a Spot Fleet.

## Contents

**instanceHealth**

The health status of the instance. If the status of either the instance status check or the system status check is `impaired`, the health status of the instance is `unhealthy`. Otherwise, the health status is `healthy`.

Type: String

Valid Values: `healthy | unhealthy`

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**instanceType**

The instance type.

Type: String

Required: No

**spotInstanceRequestId**

The ID of the Spot Instance request.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ActiveVpnTunnelStatus

Contains information about the current security configuration of an active VPN tunnel.

## Contents

**ikeVersion**

The version of the Internet Key Exchange (IKE) protocol being used.

Type: String

Required: No

**phase1DHGroup**

The Diffie-Hellman group number being used in Phase 1 IKE negotiations.

Type: Integer

Required: No

**phase1EncryptionAlgorithm**

The encryption algorithm negotiated in Phase 1 IKE negotiations.

Type: String

Required: No

**phase1IntegrityAlgorithm**

The integrity algorithm negotiated in Phase 1 IKE negotiations.

Type: String

Required: No

**phase2DHGroup**

The Diffie-Hellman group number being used in Phase 2 IKE negotiations.

Type: Integer

Required: No

**phase2EncryptionAlgorithm**

The encryption algorithm negotiated in Phase 2 IKE negotiations.

Type: String

Required: No

**phase2IntegrityAlgorithm**

The integrity algorithm negotiated in Phase 2 IKE negotiations.

Type: String

Required: No

**provisioningStatus**

The current provisioning status of the VPN tunnel.

Type: String

Valid Values: `available | pending | failed`

Required: No

**provisioningStatusReason**

The reason for the current provisioning status.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AddedPrincipal

Describes a principal.

## Contents

**principal**

The Amazon Resource Name (ARN) of the principal.

Type: String

Required: No

**principalType**

The type of principal.

Type: String

Valid Values: `All | Service | OrganizationUnit | Account | User | Role`

Required: No

**serviceId**

The ID of the service.

Type: String

Required: No

**servicePermissionId**

The ID of the service permission.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AddIpamOperatingRegion

Add an operating Region to an IPAM. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

For more information about operating Regions, see Create an IPAM in the *Amazon VPC IPAM User Guide*.

## Contents

**RegionName**

The name of the operating Region.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AddIpamOrganizationalUnitExclusion

Add an Organizational Unit (OU) exclusion to your IPAM. If your IPAM is integrated with AWS Organizations and you add an organizational unit (OU) exclusion, IPAM will not manage the IP addresses in accounts in that OU exclusion. There is a limit on the number of exclusions you can create. For more information, see Quotas for your IPAM in the *Amazon VPC IPAM User Guide*.

## Contents

**OrganizationsEntityPath**

An AWS Organizations entity path. Build the path for the OU(s) using AWS Organizations IDs separated by a /. Include all child OUs by ending the path with /*.

- Example 1
  - Path to a child OU: `o-a1b2c3d4e5/r-f6g7h8i9j0example/ou-ghi0-awsccccc/ou-jkl0-awsddddd/`
  - In this example, `o-a1b2c3d4e5` is the organization ID, `r-f6g7h8i9j0example` is the root ID , `ou-ghi0-awsccccc` is an OU ID, and `ou-jkl0-awsddddd` is a child OU ID.
  - IPAM will not manage the IP addresses in accounts in the child OU.
- Example 2
  - Path where all child OUs will be part of the exclusion: `o-a1b2c3d4e5/r-f6g7h8i9j0example/ou-ghi0-awsccccc/*`
  - In this example, IPAM will not manage the IP addresses in accounts in the OU (`ou-ghi0-awsccccc`) or in accounts in any OUs that are children of the OU.

For more information on how to construct an entity path, see Understand the AWS Organizations entity path in the *AWS Identity and Access Management User Guide*.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AdditionalDetail

Describes an additional detail for a path analysis. For more information, see Reachability Analyzer additional detail codes.

## Contents

**additionalDetailType**

The additional detail code.

Type: String

Required: No

**component**

The path component.

Type: AnalysisComponent object

Required: No

**LoadBalancerSet.N**

The load balancers.

Type: Array of AnalysisComponent objects

Required: No

**RuleGroupRuleOptionsPairSet.N**

The rule options.

Type: Array of RuleGroupRuleOptionsPair objects

Required: No

**RuleGroupTypePairSet.N**

The rule group type.

Type: Array of RuleGroupTypePair objects

Required: No

**RuleOptionSet.N**

The rule options.

Type: Array of RuleOption objects

Required: No

**serviceName**

The name of the VPC endpoint service.

Type: String

Required: No

**vpcEndpointService**

The VPC endpoint service.

Type: AnalysisComponent object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AddPrefixListEntry

An entry for a prefix list.

## Contents

**Cidr**

The CIDR block.

Type: String

Required: Yes

**Description**

A description for the entry.

Constraints: Up to 255 characters in length.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Address

Describes an Elastic IP address, or a carrier IP address.

## Contents

**allocationId**

The ID representing the allocation of the address.

Type: String

Required: No

**associationId**

The ID representing the association of the address with an instance.

Type: String

Required: No

**carrierIp**

The carrier IP address associated. This option is only available for network interfaces which reside in a subnet in a Wavelength Zone (for example an EC2 instance).

Type: String

Required: No

**customerOwnedIp**

The customer-owned IP address.

Type: String

Required: No

**customerOwnedIpv4Pool**

The ID of the customer-owned address pool.

Type: String

Required: No

**domain**

The network (`vpc`).

Type: String

Valid Values: `vpc | standard`

Required: No

**instanceId**

The ID of the instance that the address is associated with (if any).

Type: String

Required: No

**networkBorderGroup**

The name of the unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses.

Type: String

Required: No

**networkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**networkInterfaceOwnerId**

The ID of the AWS account that owns the network interface.

Type: String

Required: No

**privateIpAddress**

The private IP address associated with the Elastic IP address.

Type: String

Required: No

**publicIp**

The Elastic IP address.

Type: String

Required: No

**publicIpv4Pool**

The ID of an address pool.

Type: String

Required: No

**serviceManaged**

The service that manages the elastic IP address.

> **Note**
>
> The only option supported today is `alb`.

Type: String

Valid Values: `alb | nlb | rnat | rds`

Required: No

**subnetId**

The ID of the subnet where the IP address is allocated.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the Elastic IP address.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AddressAttribute

The attributes associated with an Elastic IP address.

## Contents

**allocationId**

[EC2-VPC] The allocation ID.

Type: String

Required: No

**ptrRecord**

The pointer (PTR) record for the IP address.

Type: String

Required: No

**ptrRecordUpdate**

The updated PTR record for the IP address.

Type: PtrUpdateStatus object

Required: No

**publicIp**

The public IP address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AddressTransfer

Details on the Elastic IP address transfer. For more information, see Transfer Elastic IP addresses in the *Amazon VPC User Guide*.

## Contents

**addressTransferStatus**

The Elastic IP address transfer status.

Type: String

Valid Values: `pending | disabled | accepted`

Required: No

**allocationId**

The allocation ID of an Elastic IP address.

Type: String

Required: No

**publicIp**

The Elastic IP address being transferred.

Type: String

Required: No

**transferAccountId**

The ID of the account that you want to transfer the Elastic IP address to.

Type: String

Required: No

**transferOfferAcceptedTimestamp**

The timestamp when the Elastic IP address transfer was accepted.

Type: Timestamp

Required: No

**transferOfferExpirationTimestamp**

The timestamp when the Elastic IP address transfer expired. When the source account starts the transfer, the transfer account has seven hours to allocate the Elastic IP address to complete the transfer, or the Elastic IP address will return to its original owner.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AllowedPrincipal

Describes a principal.

## Contents

**principal**

The Amazon Resource Name (ARN) of the principal.

Type: String

Required: No

**principalType**

The type of principal.

Type: String

Valid Values: `All | Service | OrganizationUnit | Account | User | Role`

Required: No

**serviceId**

The ID of the service.

Type: String

Required: No

**servicePermissionId**

The ID of the service permission.

Type: String

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AlternatePathHint

Describes an potential intermediate component of a feasible path.

## Contents

**componentArn**

The Amazon Resource Name (ARN) of the component.

Type: String

Required: No

**componentId**

The ID of the component.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AnalysisAclRule

Describes a network access control (ACL) rule.

## Contents

**cidr**

The IPv4 address range, in CIDR notation.

Type: String

Required: No

**egress**

Indicates whether the rule is an outbound rule.

Type: Boolean

Required: No

**portRange**

The range of ports.

Type: PortRange object

Required: No

**protocol**

The protocol.

Type: String

Required: No

**ruleAction**

Indicates whether to allow or deny traffic that matches the rule.

Type: String

Required: No

**ruleNumber**

The rule number.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AnalysisComponent

Describes a path component.

## Contents

**arn**

The Amazon Resource Name (ARN) of the component.

Type: String

Required: No

**id**

The ID of the component.

Type: String

Required: No

**name**

The name of the analysis component.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AnalysisLoadBalancerListener

Describes a load balancer listener.

## Contents

**instancePort**

[Classic Load Balancers] The back-end port for the listener.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

**loadBalancerPort**

The port on which the load balancer is listening.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AnalysisLoadBalancerTarget

Describes a load balancer target.

## Contents

**address**

The IP address.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**instance**

Information about the instance.

Type: AnalysisComponent object

Required: No

**port**

The port on which the target is listening.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AnalysisPacketHeader

Describes a header. Reflects any changes made by a component as traffic passes through. The fields of an inbound header are null except for the first component of a path.

## Contents

**DestinationAddressSet.N**

The destination addresses.

Type: Array of strings

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**DestinationPortRangeSet.N**

The destination port ranges.

Type: Array of PortRange objects

Required: No

**protocol**

The protocol.

Type: String

Required: No

**SourceAddressSet.N**

The source addresses.

Type: Array of strings

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**SourcePortRangeSet.N**

The source port ranges.

Type: Array of PortRange objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AnalysisRouteTableRoute

Describes a route table route.

## Contents

**carrierGatewayId**

The ID of a carrier gateway.

Type: String

Required: No

**coreNetworkArn**

The Amazon Resource Name (ARN) of a core network.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**destinationCidr**

The destination IPv4 address, in CIDR notation.

Type: String

Required: No

**destinationPrefixListId**

The prefix of the AWS service.

Type: String

Required: No

**egressOnlyInternetGatewayId**

The ID of an egress-only internet gateway.

Type: String

Required: No

**gatewayId**

The ID of the gateway, such as an internet gateway or virtual private gateway.

Type: String

Required: No

**instanceId**

The ID of the instance, such as a NAT instance.

Type: String

Required: No

**localGatewayId**

The ID of a local gateway.

Type: String

Required: No

**natGatewayId**

The ID of a NAT gateway.

Type: String

Required: No

**networkInterfaceId**

The ID of a network interface.

Type: String

Required: No

**origin**

Describes how the route was created. The following are the possible values:

- CreateRouteTable - The route was automatically created when the route table was created.
- CreateRoute - The route was manually added to the route table.

- EnableVgwRoutePropagation - The route was propagated by route propagation.

Type: String

Required: No

**state**

The state. The following are the possible values:

- active
- blackhole

Type: String

Required: No

**transitGatewayId**

The ID of a transit gateway.

Type: String

Required: No

**vpcPeeringConnectionId**

The ID of a VPC peering connection.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AnalysisSecurityGroupRule

Describes a security group rule.

## Contents

**cidr**

The IPv4 address range, in CIDR notation.

Type: String

Required: No

**direction**

The direction. The following are the possible values:

- egress
- ingress

Type: String

Required: No

**portRange**

The port range.

Type: PortRange object

Required: No

**prefixListId**

The prefix list ID.

Type: String

Required: No

**protocol**

The protocol name.

Type: String

Required: No

**securityGroupId**

The security group ID.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AsnAssociation

An Autonomous System Number (ASN) and BYOIP CIDR association.

## Contents

**asn**

The association's ASN.

Type: String

Required: No

**cidr**

The association's CIDR.

Type: String

Required: No

**state**

The association's state.

Type: String

Valid Values: `disassociated | failed-disassociation | failed-association | pending-disassociation | pending-association | associated`

Required: No

**statusMessage**

The association's status message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AsnAuthorizationContext

Provides authorization for Amazon to bring an Autonomous System Number (ASN) to a specific AWS account using bring your own ASN (BYOASN). For details on the format of the message and signature, see Tutorial: Bring your ASN to IPAM in the *Amazon VPC IPAM guide*.

## Contents

**Message**

The authorization context's message.

Type: String

Required: Yes

**Signature**

The authorization context's signature.

Type: String

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AssignedPrivateIpAddress

Describes the private IP addresses assigned to a network interface.

## Contents

**privateIpAddress**

The private IP address assigned to the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AssociatedRole

Information about the associated IAM roles.

## Contents

**associatedRoleArn**

The ARN of the associated IAM role.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**certificateS3BucketName**

The name of the Amazon S3 bucket in which the Amazon S3 object is stored.

Type: String

Required: No

**certificateS3ObjectKey**

The key of the Amazon S3 object where the certificate, certificate chain, and encrypted private key bundle are stored. The object key is formatted as follows: `role_arn/certificate_arn`.

Type: String

Required: No

**encryptionKmsKeyId**

The ID of the KMS key used to encrypt the private key.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AssociatedTargetNetwork

Describes a target network that is associated with a Client VPN endpoint. A target network is a subnet in a VPC.

## Contents

**networkId**

The ID of the subnet.

Type: String

Required: No

**networkType**

The target network type.

Type: String

Valid Values: vpc

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AssociationStatus

Describes the state of a target network association.

## Contents

**code**

The state of the target network association.

Type: String

Valid Values: `associating | associated | association-failed | disassociating | disassociated`

Required: No

**message**

A message about the status of the target network association, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AthenaIntegration

Describes integration options for Amazon Athena.

## Contents

**IntegrationResultS3DestinationArn**

The location in Amazon S3 to store the generated CloudFormation template.

Type: String

Required: Yes

**PartitionLoadFrequency**

The schedule for adding new partitions to the table.

Type: String

Valid Values: `none | daily | weekly | monthly`

Required: Yes

**PartitionEndDate**

The end date for the partition.

Type: Timestamp

Required: No

**PartitionStartDate**

The start date for the partition.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AttachmentEnaSrdSpecification

ENA Express uses AWS Scalable Reliable Datagram (SRD) technology to increase the maximum bandwidth used per stream and minimize tail latency of network traffic between EC2 instances. With ENA Express, you can communicate between two EC2 instances in the same subnet within the same account, or in different accounts. Both sending and receiving instances must have ENA Express enabled.

To improve the reliability of network packet delivery, ENA Express reorders network packets on the receiving end by default. However, some UDP-based applications are designed to handle network packets that are out of order to reduce the overhead for packet delivery at the network layer. When ENA Express is enabled, you can specify whether UDP network traffic uses it.

## Contents

**enaSrdEnabled**

Indicates whether ENA Express is enabled for the network interface.

Type: Boolean

Required: No

**enaSrdUdpSpecification**

Configures ENA Express for UDP network traffic.

Type: AttachmentEnaSrdUdpSpecification object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AttachmentEnaSrdUdpSpecification

ENA Express is compatible with both TCP and UDP transport protocols. When it's enabled, TCP traffic automatically uses it. However, some UDP-based applications are designed to handle network packets that are out of order, without a need for retransmission, such as live video broadcasting or other near-real-time applications. For UDP traffic, you can specify whether to use ENA Express, based on your application environment needs.

## Contents

**enaSrdUdpEnabled**

Indicates whether UDP traffic to and from the instance uses ENA Express. To specify this setting, you must first enable ENA Express.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AttributeBooleanValue

Describes a value for a resource attribute that is a Boolean value.

## Contents

**Value** (request), **value** (response)

The attribute value. The valid values are `true` or `false`.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AttributeSummary

A summary report for the attribute across all Regions.

## Contents

**attributeName**

The name of the attribute.

Type: String

Required: No

**mostFrequentValue**

The configuration value that is most frequently observed for the attribute.

Type: String

Required: No

**numberOfMatchedAccounts**

The number of accounts with the same configuration value for the attribute that is most frequently observed.

Type: Integer

Required: No

**numberOfUnmatchedAccounts**

The number of accounts with a configuration value different from the most frequently observed value for the attribute.

Type: Integer

Required: No

**RegionalSummarySet.N**

The summary report for each Region for the attribute.

Type: Array of RegionalSummary objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AttributeValue

Describes a value for a resource attribute that is a String.

## Contents

**Value** (request), **value** (response)

The attribute value. The value is case-sensitive.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AuthorizationRule

Information about an authorization rule.

## Contents

**accessAll**

Indicates whether the authorization rule grants access to all clients.

Type: Boolean

Required: No

**clientVpnEndpointId**

The ID of the Client VPN endpoint with which the authorization rule is associated.

Type: String

Required: No

**description**

A brief description of the authorization rule.

Type: String

Required: No

**destinationCidr**

The IPv4 address range, in CIDR notation, of the network to which the authorization rule applies.

Type: String

Required: No

**groupId**

The ID of the Active Directory group to which the authorization rule grants access.

Type: String

Required: No

**status**

The current state of the authorization rule.

Type: ClientVpnAuthorizationRuleStatus object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AvailabilityZone

Describes Availability Zones, Local Zones, and Wavelength Zones.

## Contents

**GeographySet.N**

The geography information for the Availability Zone or Local Zone. The geography is returned as a list.

Type: Array of AvailabilityZoneGeography objects

Required: No

**groupLongName**

The long name of the Availability Zone group, Local Zone group, or Wavelength Zone group.

Type: String

Required: No

**groupName**

The name of the zone group. For example:

- Availability Zones - `us-east-1-zg-1`
- Local Zones - `us-west-2-lax-1`
- Wavelength Zones - `us-east-1-wl1-bos-wlz-1`

Type: String

Required: No

**MessageSet.N**

Any messages about the Availability Zone, Local Zone, or Wavelength Zone.

Type: Array of AvailabilityZoneMessage objects

Required: No

**networkBorderGroup**

The name of the network border group.

Type: String

Required: No

**optInStatus**

For Availability Zones, this parameter always has the value of `opt-in-not-required`.

For Local Zones and Wavelength Zones, this parameter is the opt-in status. The possible values are `opted-in` and `not-opted-in`.

Type: String

Valid Values: `opt-in-not-required | opted-in | not-opted-in`

Required: No

**parentZoneId**

The ID of the zone that handles some of the Local Zone or Wavelength Zone control plane operations, such as API calls.

Type: String

Required: No

**parentZoneName**

The name of the zone that handles some of the Local Zone or Wavelength Zone control plane operations, such as API calls.

Type: String

Required: No

**regionName**

The name of the Region.

Type: String

Required: No

**SubGeographySet.N**

The sub-geography information for the Availability Zone or Local Zone. The sub-geography is returned as a list.

Type: Array of AvailabilityZoneSubGeography objects

Required: No

**zoneId**

The ID of the Availability Zone, Local Zone, or Wavelength Zone.

Type: String

Required: No

**zoneName**

The name of the Availability Zone, Local Zone, or Wavelength Zone.

Type: String

Required: No

**zoneState**

The state of the Availability Zone, Local Zone, or Wavelength Zone. The possible values are `available`, `unavailable`, and `constrained`.

Type: String

Valid Values: `available | information | impaired | unavailable | constrained`

Required: No

**zoneType**

The type of zone.

Valid values: `availability-zone` | `local-zone` | `wavelength-zone`

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AvailabilityZoneAddress

For regional NAT gateways only: The configuration specifying which Elastic IP address (EIP) to use for handling outbound NAT traffic from a specific Availability Zone.

A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

For more information, see Regional NAT gateways for automatic multi-AZ expansion in the *Amazon VPC User Guide*.

## Contents

**AllocationId.N**

The allocation IDs of the Elastic IP addresses (EIPs) to be used for handling outbound NAT traffic in this specific Availability Zone.

Type: Array of strings

Required: No

**AvailabilityZone**

For regional NAT gateways only: The Availability Zone where this specific NAT gateway configuration will be active. Each AZ in a regional NAT gateway has its own configuration to handle outbound NAT traffic from that AZ.

A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

Type: String

Required: No

**AvailabilityZoneId**

For regional NAT gateways only: The ID of the Availability Zone where this specific NAT gateway configuration will be active. Each AZ in a regional NAT gateway has its own configuration to handle outbound NAT traffic from that AZ. Use this instead of AvailabilityZone for consistent identification of AZs across AWS Regions.

A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AvailabilityZoneGeography

Describes the geography information for an Availability Zone or Local Zone.

## Contents

**name**

The name of the geography, for example, `United States of America`.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AvailabilityZoneMessage

Describes a message about an Availability Zone, Local Zone, or Wavelength Zone.

## Contents

**message**

The message about the Availability Zone, Local Zone, or Wavelength Zone.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AvailabilityZoneSubGeography

Describes the sub-geography information for an Availability Zone or Local Zone.

## Contents

**name**

The name of the sub-geography, for example, `Oregon`.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# AvailableCapacity

The capacity information for instances that can be launched onto the Dedicated Host.

## Contents

**AvailableInstanceCapacity.N**

The number of instances that can be launched onto the Dedicated Host depending on the host's available capacity. For Dedicated Hosts that support multiple instance types, this parameter represents the number of instances for each instance size that is supported on the host.

Type: Array of InstanceCapacity objects

Required: No

**availableVCpus**

The number of vCPUs available for launching instances onto the Dedicated Host.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BaselineEbsBandwidthMbps

The minimum and maximum baseline bandwidth to Amazon EBS, in Mbps. For more information, see Amazon EBS–optimized instances in the *Amazon EC2 User Guide*.

## Contents

**Max** (request), **max** (response)

The maximum baseline bandwidth, in Mbps. If this parameter is not specified, there is no maximum limit.

Type: Integer

Required: No

**Min** (request), **min** (response)

The minimum baseline bandwidth, in Mbps. If this parameter is not specified, there is no minimum limit.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BaselineEbsBandwidthMbpsRequest

The minimum and maximum baseline bandwidth to Amazon EBS, in Mbps. For more information, see Amazon EBS–optimized instances in the *Amazon EC2 User Guide*.

## Contents

**Max**

The maximum baseline bandwidth, in Mbps. To specify no maximum limit, omit this parameter.

Type: Integer

Required: No

**Min**

The minimum baseline bandwidth, in Mbps. To specify no minimum limit, omit this parameter.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BaselinePerformanceFactors

The baseline performance to consider, using an instance family as a baseline reference. The instance family establishes the lowest acceptable level of performance. Amazon EC2 uses this baseline to guide instance type selection, but there is no guarantee that the selected instance types will always exceed the baseline for every application.

Currently, this parameter only supports CPU performance as a baseline performance factor. For example, specifying `c6i` would use the CPU performance of the `c6i` family as the baseline reference.

## Contents

**Cpu** (request), **cpu** (response)

The CPU performance to consider, using an instance family as the baseline reference.

Type: CpuPerformanceFactor object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BaselinePerformanceFactorsRequest

The baseline performance to consider, using an instance family as a baseline reference. The instance family establishes the lowest acceptable level of performance. Amazon EC2 uses this baseline to guide instance type selection, but there is no guarantee that the selected instance types will always exceed the baseline for every application.

Currently, this parameter only supports CPU performance as a baseline performance factor. For example, specifying `c6i` would use the CPU performance of the `c6i` family as the baseline reference.

## Contents

**Cpu**

The CPU performance to consider, using an instance family as the baseline reference.

Type: CpuPerformanceFactorRequest object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BlockDeviceMapping

Describes a block device mapping, which defines the EBS volumes and instance store volumes to attach to an instance at launch.

## Contents

**DeviceName** (request), **deviceName** (response)

The device name. For available device names, see Device names for volumes.

Type: String

Required: No

**Ebs** (request), **ebs** (response)

Parameters used to automatically set up EBS volumes when the instance is launched.

Type: EbsBlockDevice object

Required: No

**NoDevice** (request), **noDevice** (response)

To omit the device from the block device mapping, specify an empty string. When this property is specified, the device is removed from the block device mapping regardless of the assigned value.

Type: String

Required: No

**VirtualName** (request), **virtualName** (response)

The virtual device name (`ephemeralN`). Instance store volumes are numbered starting from 0. An instance type with 2 available instance store volumes can specify mappings for `ephemeral0` and `ephemeral1`. The number of available instance store volumes depends on the instance type. After you connect to the instance, you must mount the volume.

NVMe instance store volumes are automatically enumerated and assigned a device name. Including them in your block device mapping has no effect.

Constraints: For M3 instances, you must specify instance store volumes in the block device mapping for the instance. When you launch an M3 instance, we ignore any instance store volumes specified in the block device mapping for the AMI.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BlockDeviceMappingResponse

Describes a block device mapping, which defines the EBS volumes and instance store volumes to attach to an instance at launch.

## Contents

**deviceName**

The device name (for example, `/dev/sdh` or `xvdh`).

Type: String

Required: No

**ebs**

Parameters used to automatically set up EBS volumes when the instance is launched.

Type: EbsBlockDeviceResponse object

Required: No

**noDevice**

Suppresses the specified device included in the block device mapping.

Type: String

Required: No

**virtualName**

The virtual device name.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BlockPublicAccessStates

The state of VPC Block Public Access (BPA).

## Contents

**internetGatewayBlockMode**

The mode of VPC BPA.

- `off`: VPC BPA is not enabled and traffic is allowed to and from internet gateways and egress-only internet gateways in this Region.
- `block-bidirectional`: Block all traffic to and from internet gateways and egress-only internet gateways in this Region (except for excluded VPCs and subnets).
- `block-ingress`: Block all internet traffic to the VPCs in this Region (except for VPCs or subnets which are excluded). Only traffic to and from NAT gateways and egress-only internet gateways is allowed because these gateways only allow outbound connections to be established.

Type: String

Valid Values: `off | block-bidirectional | block-ingress`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BundleTask

Describes a bundle task.

## Contents

**bundleId**

The ID of the bundle task.

Type: String

Required: No

**error**

If the task fails, a description of the error.

Type: BundleTaskError object

Required: No

**instanceId**

The ID of the instance associated with this bundle task.

Type: String

Required: No

**progress**

The level of task completion, as a percent (for example, 20%).

Type: String

Required: No

**startTime**

The time this task started.

Type: Timestamp

Required: No

**state**

The state of the task.

Type: String

Valid Values: `pending | waiting-for-shutdown | bundling | storing | cancelling | complete | failed`

Required: No

**storage**

The Amazon S3 storage locations.

Type: Storage object

Required: No

**updateTime**

The time of the most recent update for the task.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# BundleTaskError

Describes an error for BundleInstance.

## Contents

**code**

The error code.

Type: String

Required: No

**message**

The error message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Byoasn

The Autonomous System Number (ASN) and BYOIP CIDR association.

## Contents

**asn**

A public 2-byte or 4-byte ASN.

Type: String

Required: No

**ipamId**

An IPAM ID.

Type: String

Required: No

**state**

The provisioning state of the BYOASN.

Type: String

Valid Values: `deprovisioned | failed-deprovision | failed-provision | pending-deprovision | pending-provision | provisioned`

Required: No

**statusMessage**

The status message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ByoipCidr

Information about an address range that is provisioned for use with your AWS resources through bring your own IP addresses (BYOIP).

## Contents

**advertisementType**

Specifies the advertisement method for the BYOIP CIDR. Valid values are:

- `unicast`: IP is advertised from a single location (regional services like EC2)
- `anycast`: IP is advertised from multiple global locations simultaneously (global services like CloudFront)

For more information, see Bring your own IP to CloudFront using IPAM in the *Amazon VPC IPAM User Guide*.

Type: String

Required: No

**AsnAssociationSet.N**

The BYOIP CIDR associations with ASNs.

Type: Array of AsnAssociation objects

Required: No

**cidr**

The address range, in CIDR notation.

Type: String

Required: No

**description**

The description of the address range.

Type: String

Required: No

**networkBorderGroup**

If you have Local Zones enabled, you can choose a network border group for Local Zones when you provision and advertise a BYOIPv4 CIDR. Choose the network border group carefully as the EIP and the AWS resource it is associated with must reside in the same network border group.

You can provision BYOIP address ranges to and advertise them in the following Local Zone network border groups:

- us-east-1-dfw-2
- us-west-2-lax-1
- us-west-2-phx-2

> **Note**
>
> You cannot provision or advertise BYOIPv6 address ranges in Local Zones at this time.

Type: String

Required: No

**state**

The state of the address range.

- `advertised`: The address range is being advertised to the internet by AWS.
- `deprovisioned`: The address range is deprovisioned.
- `failed-deprovision`: The request to deprovision the address range was unsuccessful. Ensure that all EIPs from the range have been deallocated and try again.
- `failed-provision`: The request to provision the address range was unsuccessful.
- `pending-deprovision`: You've submitted a request to deprovision an address range and it's pending.
- `pending-provision`: You've submitted a request to provision an address range and it's pending.
- `provisioned`: The address range is provisioned and can be advertised. The range is not currently advertised.
- `provisioned-not-publicly-advertisable`: The address range is provisioned and cannot be advertised.

Type: String

Valid Values: `advertised | deprovisioned | failed-deprovision | failed-provision | pending-advertising | pending-deprovision | pending-provision | pending-withdrawal | provisioned | provisioned-not-publicly-advertisable`

Required: No

**statusMessage**

Upon success, contains the ID of the address pool. Otherwise, contains an error message.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CancelCapacityReservationFleetError

Describes a Capacity Reservation Fleet cancellation error.

## Contents

**code**

The error code.

Type: String

Required: No

**message**

The error message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CancellationTerms

Describes the cancellation terms for cancelling a future-dated Capacity Reservation during its commitment duration.

## Contents

**cancellationType**

The type of cancellation charge. Possible values include `commitment-wind-down`.

Type: String

Valid Values: `commitment-wind-down`

Required: No

**chargeCommitmentDurationHours**

The number of hours for which cancellation charges will apply.

Type: Long

Required: No

**chargeEndDate**

The date and time at which cancellation charges will stop.

Type: Timestamp

Required: No

**committedInstanceCount**

The number of instances under commitment after cancellation.

Type: Integer

Required: No

**reservationState**

The state that the Capacity Reservation will transition to after cancellation.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CancelledSpotInstanceRequest

Describes a request to cancel a Spot Instance.

## Contents

**spotInstanceRequestId**

The ID of the Spot Instance request.

Type: String

Required: No

**state**

The state of the Spot Instance request.

Type: String

Valid Values: `active | open | closed | cancelled | completed`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CancelSpotFleetRequestsError

Describes a Spot Fleet error.

## Contents

**code**

The error code.

Type: String

Valid Values: `fleetRequestIdDoesNotExist | fleetRequestIdMalformed | fleetRequestNotInCancellableState | unexpectedError`

Required: No

**message**

The description for the error code.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CancelSpotFleetRequestsErrorItem

Describes a Spot Fleet request that was not successfully canceled.

## Contents

**error**

The error.

Type: CancelSpotFleetRequestsError object

Required: No

**spotFleetRequestId**

The ID of the Spot Fleet request.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CancelSpotFleetRequestsSuccessItem

Describes a Spot Fleet request that was successfully canceled.

## Contents

**currentSpotFleetRequestState**

The current state of the Spot Fleet request.

Type: String

Valid Values: `submitted | active | cancelled | failed | cancelled_running | cancelled_terminating | modifying`

Required: No

**previousSpotFleetRequestState**

The previous state of the Spot Fleet request.

Type: String

Valid Values: `submitted | active | cancelled | failed | cancelled_running | cancelled_terminating | modifying`

Required: No

**spotFleetRequestId**

The ID of the Spot Fleet request.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityAllocation

Information about instance capacity usage for a Capacity Reservation.

## Contents

**AllocationMetadataList.N**

Additional metadata associated with the capacity allocation. Each entry contains a key-value pair providing context about the allocation.

Type: Array of CapacityAllocationMetadataEntry objects

Required: No

**allocationType**

The usage type. `used` indicates that the instance capacity is in use by instances that are running in the Capacity Reservation.

Type: String

Valid Values: `used | cancelling`

Required: No

**count**

The amount of instance capacity associated with the usage. For example a value of 4 indicates that instance capacity for 4 instances is currently in use.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# CapacityAllocationMetadataEntry

A key-value pair that provides additional metadata about a capacity allocation.

## Contents

**key**

The key of the metadata entry.

Type: String

Required: No

**value**

The value of the metadata entry.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityBlock

Reserve powerful GPU instances on a future date to support your short duration machine learning (ML) workloads. Instances that run inside a Capacity Block are automatically placed close together inside Amazon EC2 UltraClusters, for low-latency, petabit-scale, non-blocking networking.

You can also reserve Amazon EC2 UltraServers. UltraServers connect multiple EC2 instances using a low-latency, high-bandwidth accelerator interconnect (NeuronLink). They are built to tackle very large-scale AI/ML workloads that require significant processing power. For more information, see Amazon EC2 UltraServers.

## Contents

**availabilityZone**

The Availability Zone of the Capacity Block.

Type: String

Required: No

**availabilityZoneId**

The Availability Zone ID of the Capacity Block.

Type: String

Required: No

**capacityBlockId**

The ID of the Capacity Block.

Type: String

Required: No

**CapacityReservationIdSet.N**

The ID of the Capacity Reservation.

Type: Array of strings

Required: No

**createDate**

The date and time at which the Capacity Block was created.

Type: Timestamp

Required: No

**endDate**

The date and time at which the Capacity Block expires. When a Capacity Block expires, all instances in the Capacity Block are terminated.

Type: Timestamp

Required: No

**startDate**

The date and time at which the Capacity Block was started.

Type: Timestamp

Required: No

**state**

The state of the Capacity Block.

Type: String

Valid Values: `active | expired | unavailable | cancelled | failed | scheduled | payment-pending | payment-failed`

Required: No

**TagSet.N**

The tags assigned to the Capacity Block.

Type: Array of Tag objects

Required: No

**ultraserverType**

The EC2 UltraServer type of the Capacity Block.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityBlockExtension

Describes a Capacity Block extension. With an extension, you can extend the duration of time for an existing Capacity Block.

## Contents

**availabilityZone**

The Availability Zone of the Capacity Block extension.

Type: String

Required: No

**availabilityZoneId**

The Availability Zone ID of the Capacity Block extension.

Type: String

Required: No

**capacityBlockExtensionDurationHours**

The duration of the Capacity Block extension in hours.

Type: Integer

Required: No

**capacityBlockExtensionEndDate**

The end date of the Capacity Block extension.

Type: Timestamp

Required: No

**capacityBlockExtensionOfferingId**

The ID of the Capacity Block extension offering.

Type: String

Required: No

**capacityBlockExtensionPurchaseDate**

The date when the Capacity Block extension was purchased.

Type: Timestamp

Required: No

**capacityBlockExtensionStartDate**

The start date of the Capacity Block extension.

Type: Timestamp

Required: No

**capacityBlockExtensionStatus**

The status of the Capacity Block extension. A Capacity Block extension can have one of the following statuses:

- `payment-pending` - The Capacity Block extension payment is processing. If your payment can't be processed within 12 hours, the Capacity Block extension is failed.
- `payment-failed` - Payment for the Capacity Block extension request was not successful.
- `payment-succeeded` - Payment for the Capacity Block extension request was successful. You receive an invoice that reflects the one-time upfront payment. In the invoice, you can associate the paid amount with the Capacity Block reservation ID.

Type: String

Valid Values: `payment-pending | payment-failed | payment-succeeded`

Required: No

**capacityReservationId**

The reservation ID of the Capacity Block extension.

Type: String

Required: No

**currencyCode**

The currency of the payment for the Capacity Block extension.

Type: String

Required: No

**instanceCount**

The number of instances in the Capacity Block extension.

Type: Integer

Required: No

**instanceType**

The instance type of the Capacity Block extension.

Type: String

Required: No

**upfrontFee**

The total price to be paid up front.

Type: String

Required: No

**zoneType**

The type of zone where the Capacity Block extension is located.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityBlockExtensionOffering

The recommended Capacity Block extension that fits your search requirements.

## Contents

**availabilityZone**

The Availability Zone of the Capacity Block that will be extended.

Type: String

Required: No

**availabilityZoneId**

The Availability Zone ID of the Capacity Block that will be extended.

Type: String

Required: No

**capacityBlockExtensionDurationHours**

The amount of time of the Capacity Block extension offering in hours.

Type: Integer

Required: No

**capacityBlockExtensionEndDate**

The date and time at which the Capacity Block extension expires. When a Capacity Block expires, the reserved capacity is released and you can no longer launch instances into it. The Capacity Block's state changes to `expired` when it reaches its end date

Type: Timestamp

Required: No

**capacityBlockExtensionOfferingId**

The ID of the Capacity Block extension offering.

Type: String

Required: No

**capacityBlockExtensionStartDate**

The date and time at which the Capacity Block extension will start. This date is also the same as the end date of the Capacity Block that will be extended.

Type: Timestamp

Required: No

**currencyCode**

The currency of the payment for the Capacity Block extension offering.

Type: String

Required: No

**instanceCount**

The number of instances in the Capacity Block extension offering.

Type: Integer

Required: No

**instanceType**

The instance type of the Capacity Block that will be extended.

Type: String

Required: No

**startDate**

The start date of the Capacity Block that will be extended.

Type: Timestamp

Required: No

**tenancy**

Indicates the tenancy of the Capacity Block extension offering. A Capacity Block can have one of the following tenancy settings:

- `default` - The Capacity Block is created on hardware that is shared with other AWS accounts.
- `dedicated` - The Capacity Block is created on single-tenant hardware that is dedicated to a single AWS account.

Type: String

Valid Values: `default | dedicated`

Required: No

**upfrontFee**

The total price of the Capacity Block extension offering, to be paid up front.

Type: String

Required: No

**zoneType**

The type of zone where the Capacity Block extension offering is available.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityBlockOffering

The recommended Capacity Block that fits your search requirements.

## Contents

**availabilityZone**

The Availability Zone of the Capacity Block offering.

Type: String

Required: No

**capacityBlockDurationHours**

The number of hours (in addition to `capacityBlockDurationMinutes`) for the duration of the Capacity Block reservation. For example, if a Capacity Block starts at **04:55** and ends at **11:30**, the hours field would be **6**.

Type: Integer

Required: No

**capacityBlockDurationMinutes**

The number of minutes (in addition to `capacityBlockDurationHours`) for the duration of the Capacity Block reservation. For example, if a Capacity Block starts at **08:55** and ends at **11:30**, the minutes field would be **35**.

Type: Integer

Required: No

**capacityBlockOfferingId**

The ID of the Capacity Block offering.

Type: String

Required: No

**currencyCode**

The currency of the payment for the Capacity Block.

Type: String

Required: No

**endDate**

The end date of the Capacity Block offering.

Type: Timestamp

Required: No

**instanceCount**

The number of instances in the Capacity Block offering.

Type: Integer

Required: No

**instanceType**

The instance type of the Capacity Block offering.

Type: String

Required: No

**startDate**

The start date of the Capacity Block offering.

Type: Timestamp

Required: No

**tenancy**

The tenancy of the Capacity Block.

Type: String

Valid Values: `default | dedicated`

Required: No

**ultraserverCount**

The number of EC2 UltraServers in the offering.

Type: Integer

Required: No

**ultraserverType**

The EC2 UltraServer type of the Capacity Block offering.

Type: String

Required: No

**upfrontFee**

The total price to be paid up front.

Type: String

Required: No

**zoneType**

The type of zone where the Capacity Block offering is available.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityBlockStatus

Describes the availability of capacity for a Capacity Block.

## Contents

**capacityBlockId**

The ID of the Capacity Block.

Type: String

Required: No

**CapacityReservationStatusSet.N**

The availability of capacity for the Capacity Block reservations.

Type: Array of CapacityReservationStatus objects

Required: No

**interconnectStatus**

The status of the high-bandwidth accelerator interconnect. Possible states include:

- ok the accelerator interconnect is healthy.
- `impaired` - accelerator interconnect communication is impaired.
- `insufficient-data` - insufficient data to determine accelerator interconnect status.

Type: String

Valid Values: `ok | impaired | insufficient-data`

Required: No

**totalAvailableCapacity**

The remaining capacity. Indicates the number of resources that can be launched into the Capacity Block.

Type: Integer

Required: No

**totalCapacity**

The combined amount of `Available` and `Unavailable` capacity in the Capacity Block.

Type: Integer

Required: No

**totalUnavailableCapacity**

The unavailable capacity. Indicates the instance capacity that is unavailable for use due to a system status check failure.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityManagerCondition

Represents a filter condition for Capacity Manager queries. Contains dimension-based filtering criteria used to narrow down metric data and dimension results.

## Contents

**DimensionCondition**

The dimension-based condition that specifies how to filter the data based on dimension values.

Type: DimensionCondition object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityManagerDataExportResponse

Contains information about a Capacity Manager data export configuration, including export settings, delivery status, and recent export activity.

## Contents

**capacityManagerDataExportId**

The unique identifier for the data export configuration.

Type: String

Required: No

**createTime**

The timestamp when the data export configuration was created.

Type: Timestamp

Required: No

**latestDeliveryS3LocationUri**

The S3 URI of the most recently delivered export file.

Type: String

Required: No

**latestDeliveryStatus**

The status of the most recent export delivery.

Type: String

Valid Values: `pending | in-progress | delivered | failed`

Required: No

**latestDeliveryStatusMessage**

A message describing the status of the most recent export delivery, including any error details if the delivery failed.

Type: String

Required: No

**latestDeliveryTime**

The timestamp when the most recent export was delivered to S3.

Type: Timestamp

Required: No

**outputFormat**

The file format of the exported data.

Type: String

Valid Values: `csv | parquet`

Required: No

**s3BucketName**

The name of the S3 bucket where export files are delivered.

Type: String

Required: No

**s3BucketPrefix**

The S3 key prefix used for organizing export files within the bucket.

Type: String

Required: No

**schedule**

The frequency at which data exports are generated.

Type: String

Valid Values: `hourly`

Required: No

**TagSet.N**

The tags associated with the data export configuration.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityManagerDimension

Represents dimension values for capacity metrics, including resource identifiers, geographic information, and reservation details used for grouping and filtering capacity data.

## Contents

**accountId**

The AWS account ID that owns the capacity resource.

Type: String

Required: No

**accountName**

The name of the AWS account that owns the capacity resource. This dimension is only available when Organizations access is enabled for Capacity Manager.

Type: String

Required: No

**availabilityZoneId**

The unique identifier of the Availability Zone where the capacity resource is located.

Type: String

Required: No

**instanceFamily**

The EC2 instance family of the capacity resource.

Type: String

Required: No

**instancePlatform**

The platform or operating system of the instance.

Type: String

Required: No

**instanceType**

The specific EC2 instance type of the capacity resource.

Type: String

Required: No

**reservationArn**

The Amazon Resource Name (ARN) of the capacity reservation. This provides a unique identifier that can be used across AWS services to reference the specific reservation.

Type: String

Required: No

**reservationCreateTimestamp**

The timestamp when the capacity reservation was originally created, in milliseconds since epoch. This differs from the start timestamp as reservations can be created before they become active.

Type: Timestamp

Required: No

**reservationEndDateType**

The type of end date for the capacity reservation. This indicates whether the reservation has a fixed end date, is open-ended, or follows a specific termination pattern.

Type: String

Valid Values: `limited | unlimited`

Required: No

**reservationEndTimestamp**

The timestamp when the capacity reservation expires and is no longer available, in milliseconds since epoch. After this time, the reservation will not provide any capacity.

Type: Timestamp

Required: No

**reservationId**

The unique identifier of the capacity reservation.

Type: String

Required: No

**reservationInstanceMatchCriteria**

The instance matching criteria for the capacity reservation, determining how instances are matched to the reservation.

Type: String

Required: No

**reservationStartTimestamp**

The timestamp when the capacity reservation becomes active and available for use, in milliseconds since epoch. This is when the reservation begins providing capacity.

Type: Timestamp

Required: No

**reservationState**

The current state of the capacity reservation.

Type: String

Valid Values: `active | expired | cancelled | scheduled | pending | failed | delayed | unsupported | payment-pending | payment-failed | retired`

Required: No

**reservationType**

The type of capacity reservation.

Type: String

Valid Values: `capacity-block | odcr`

Required: No

**reservationUnusedFinancialOwner**

The AWS account ID that is financially responsible for unused capacity reservation costs.

Type: String

Required: No

**resourceRegion**

The AWS Region where the capacity resource is located.

Type: String

Required: No

**TagSet.N**

The tags associated with the capacity resource, represented as key-value pairs. Only tags that have been activated for monitoring via `UpdateCapacityManagerMonitoredTagKeys` are included.

Type: Array of CapacityManagerTagDimension objects

Required: No

**tenancy**

The tenancy of the EC2 instances associated with this capacity dimension. Valid values are 'default' for shared tenancy, 'dedicated' for dedicated instances, or 'host' for dedicated hosts.

Type: String

Valid Values: `default | dedicated`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityManagerMonitoredTagKey

Describes a tag key that is being monitored by Capacity Manager, including its activation status and the earliest available data point.

## Contents

**capacityManagerProvided**

Indicates whether this tag key is provided by Capacity Manager by default, rather than being user-activated.

Type: Boolean

Required: No

**earliestDatapointTimestamp**

The earliest timestamp from which tag data is available for queries, in UTC ISO 8601 format.

Type: Timestamp

Required: No

**status**

The current status of the monitored tag key. Valid values are `activating`, `activated`, `deactivating`, and `suspended`.

Type: String

Valid Values: `activating | activated | deactivating | suspended`

Required: No

**statusMessage**

A message providing additional details about the current status of the monitored tag key.

Type: String

Required: No

**tagKey**

The tag key being monitored.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityManagerTagDimension

A key-value pair representing a tag associated with a capacity resource in Capacity Manager.

## Contents

**key**

The tag key.

Type: String

Required: No

**value**

The tag value.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservation

Describes a Capacity Reservation.

## Contents

**availabilityZone**

The Availability Zone in which the capacity is reserved.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone in which the capacity is reserved.

Type: String

Required: No

**availableInstanceCount**

The remaining capacity. Indicates the number of instances that can be launched in the Capacity Reservation.

Type: Integer

Required: No

**CapacityAllocationSet.N**

Information about instance capacity usage.

Type: Array of CapacityAllocation objects

Required: No

**capacityBlockId**

The ID of the Capacity Block.

Type: String

Required: No

**capacityReservationArn**

The Amazon Resource Name (ARN) of the Capacity Reservation.

Type: String

Required: No

**capacityReservationFleetId**

The ID of the Capacity Reservation Fleet to which the Capacity Reservation belongs. Only valid for Capacity Reservations that were created by a Capacity Reservation Fleet.

Type: String

Required: No

**capacityReservationId**

The ID of the Capacity Reservation.

Type: String

Required: No

**commitmentInfo**

Information about your commitment for a future-dated Capacity Reservation.

Type: CapacityReservationCommitmentInfo object

Required: No

**createDate**

The date and time the Capacity Reservation was created.

Type: Timestamp

Required: No

**deliveryPreference**

The delivery method for a future-dated Capacity Reservation. `incremental` indicates that the requested capacity is delivered in addition to any running instances and reserved capacity that you have in your account at the requested date and time.

Type: String

Valid Values: `fixed | incremental`

Required: No

**ebsOptimized**

Indicates whether the Capacity Reservation supports EBS-optimized instances. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS- optimized instance.

Type: Boolean

Required: No

**endDate**

The date and time the Capacity Reservation expires. When a Capacity Reservation expires, the reserved capacity is released and you can no longer launch instances into it. The Capacity Reservation's state changes to `expired` when it reaches its end date and time.

Type: Timestamp

Required: No

**endDateType**

Indicates the way in which the Capacity Reservation ends. A Capacity Reservation can have one of the following end types:

- `unlimited` - The Capacity Reservation remains active until you explicitly cancel it.
- `limited` - The Capacity Reservation expires automatically at a specified date and time.

Type: String

Valid Values: `unlimited | limited`

Required: No

**ephemeralStorage**

*Deprecated.*

Type: Boolean

Required: No

**instanceMatchCriteria**

Indicates the type of instance launches that the Capacity Reservation accepts. The options include:

- `open` - The Capacity Reservation accepts all instances that have matching attributes (instance type, platform, and Availability Zone). Instances that have matching attributes launch into the Capacity Reservation automatically without specifying any additional parameters.
- `targeted` - The Capacity Reservation only accepts instances that have matching attributes (instance type, platform, and Availability Zone), and explicitly target the Capacity Reservation. This ensures that only permitted instances can use the reserved capacity.

Type: String

Valid Values: `open | targeted`

Required: No

**instancePlatform**

The type of operating system for which the Capacity Reservation reserves capacity.

Type: String

Valid Values: `Linux/UNIX | Red Hat Enterprise Linux | SUSE Linux | Windows | Windows with SQL Server | Windows with SQL Server Enterprise | Windows with SQL Server Standard | Windows with SQL Server Web | Linux with SQL Server Standard | Linux with SQL Server Web | Linux with SQL Server Enterprise | RHEL with SQL Server Standard | RHEL with SQL Server Enterprise | RHEL with SQL Server Web | RHEL with HA | RHEL with HA and SQL Server Standard | RHEL with HA and SQL Server Enterprise | Ubuntu Pro`

Required: No

**instanceType**

The type of instance for which the Capacity Reservation reserves capacity.

Type: String

Required: No

**interruptible**

Indicates whether this Capacity Reservation is interruptible, meaning instances may be terminated when the owner reclaims capacity.

Type: Boolean

Required: No

**interruptibleCapacityAllocation**

Contains allocation details for interruptible reservations, including current allocated instances and target instance counts within the interruptibleCapacityAllocation object.

Type: InterruptibleCapacityAllocation object

Required: No

**interruptionInfo**

Information about the interruption configuration and association with the source reservation for interruptible Capacity Reservations.

Type: InterruptionInfo object

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost on which the Capacity Reservation was created.

Type: String

Pattern: `^arn:aws([a-z-]+)?:outposts:[a-z\d-]+:\d{12}:outpost/op-[a-f0-9]{17}$`

Required: No

**ownerId**

The ID of the AWS account that owns the Capacity Reservation.

Type: String

Required: No

**placementGroupArn**

The Amazon Resource Name (ARN) of the cluster placement group in which the Capacity Reservation was created. For more information, see Capacity Reservations for cluster placement groups in the *Amazon EC2 User Guide*.

Type: String

Pattern: `^arn:aws([a-z-]+)?:ec2:[a-z\d-]+:\d{12}:placement-group/^.{1,255}$`

Required: No

**reservationType**

The type of Capacity Reservation.

Type: String

Valid Values: `default | capacity-block`

Required: No

**startDate**

The date and time the Capacity Reservation was started.

Type: Timestamp

Required: No

**state**

The current state of the Capacity Reservation. A Capacity Reservation can be in one of the following states:

- `active` - The capacity is available for use.
- `expired` - The Capacity Reservation expired automatically at the date and time specified in your reservation request. The reserved capacity is no longer available for your use.
- `cancelled` - The Capacity Reservation was canceled. The reserved capacity is no longer available for your use.

- `pending` - The Capacity Reservation request was successful but the capacity provisioning is still pending.
- `failed` - The Capacity Reservation request has failed. A request can fail due to request parameters that are not valid, capacity constraints, or instance limit constraints. You can view a failed request for 60 minutes.
- `scheduled` - (*Future-dated Capacity Reservations*) The future-dated Capacity Reservation request was approved and the Capacity Reservation is scheduled for delivery on the requested start date.
- `payment-pending` - (*Capacity Blocks*) The upfront payment has not been processed yet.
- `payment-failed` - (*Capacity Blocks*) The upfront payment was not processed in the 12-hour time frame. Your Capacity Block was released.
- `assessing` - (*Future-dated Capacity Reservations*) Amazon EC2 is assessing your request for a future-dated Capacity Reservation.
- `delayed` - (*Future-dated Capacity Reservations*) Amazon EC2 encountered a delay in provisioning the requested future-dated Capacity Reservation. Amazon EC2 is unable to deliver the requested capacity by the requested start date and time.
- `unsupported` - (*Future-dated Capacity Reservations*) Amazon EC2 can't support the future-dated Capacity Reservation request due to capacity constraints. You can view unsupported requests for 30 days. The Capacity Reservation will not be delivered.
- `cancelling` - (*Future-dated Capacity Reservations*) The Capacity Reservation is being cancelled. Capacity has been released but charges continue for the commitment wind-down period. The reservation transitions to `cancelled` when the wind-down completes.

Type: String

Valid Values: `active | expired | cancelled | pending | failed | scheduled | payment-pending | payment-failed | assessing | delayed | unsupported | cancelling | unavailable`

Required: No

**TagSet.N**

Any tags assigned to the Capacity Reservation.

Type: Array of Tag objects

Required: No

**tenancy**

Indicates the tenancy of the Capacity Reservation. A Capacity Reservation can have one of the following tenancy settings:

- `default` - The Capacity Reservation is created on hardware that is shared with other AWS accounts.
- `dedicated` - The Capacity Reservation is created on single-tenant hardware that is dedicated to a single AWS account.

Type: String

Valid Values: `default | dedicated`

Required: No

**totalInstanceCount**

The total number of instances for which the Capacity Reservation reserves capacity.

Type: Integer

Required: No

**unusedReservationBillingOwnerId**

The ID of the AWS account to which billing of the unused capacity of the Capacity Reservation is assigned.

Type: String

Length Constraints: Fixed length of 12.

Pattern: `[0-9]{12}`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationBillingRequest

Information about a request to assign billing of the unused capacity of a Capacity Reservation.

## Contents

**capacityReservationId**

The ID of the Capacity Reservation.

Type: String

Required: No

**capacityReservationInfo**

Information about the Capacity Reservation.

Type: CapacityReservationInfo object

Required: No

**lastUpdateTime**

The date and time, in UTC time format, at which the request was initiated.

Type: Timestamp

Required: No

**requestedBy**

The ID of the AWS account that initiated the request.

Type: String

Required: No

**status**

The status of the request. For more information, see View billing assignment requests for a shared Amazon EC2 Capacity Reservation.

Type: String

Valid Values: `pending | accepted | rejected | cancelled | revoked | expired`

Required: No

**statusMessage**

Information about the status.

Type: String

Required: No

**unusedReservationBillingOwnerId**

The ID of the AWS account to which the request was sent.

Type: String

Length Constraints: Fixed length of 12.

Pattern: `[0-9]{12}`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationCancellationQuote

Describes a Capacity Reservation cancellation quote, which provides the cancellation terms for cancelling a future-dated Capacity Reservation during its commitment duration.

## Contents

**CancellationTermSet.N**

The cancellation terms associated with the quote, including the fee type and charge details.

Type: Array of CancellationTerms objects

Required: No

**capacityReservationCancellationQuoteId**

The ID of the cancellation quote.

Type: String

Required: No

**capacityReservationId**

The ID of the Capacity Reservation associated with the cancellation quote.

Type: String

Required: No

**createTime**

The date and time at which the cancellation quote was created.

Type: Timestamp

Required: No

**currentConfiguration**

The current configuration of the Capacity Reservation.

Type: CapacityReservationConfiguration object

Required: No

**expirationTime**

The date and time at which the cancellation quote expires.

Type: Timestamp

Required: No

**quoteState**

The state of the cancellation quote. Possible values include `pending`, `active`, and `expired`.

Type: String

Valid Values: `pending | active | expired`

Required: No

**TagSet.N**

The tags assigned to the cancellation quote.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationCommitmentInfo

Information about your commitment for a future-dated Capacity Reservation.

## Contents

**commitmentEndDate**

The date and time at which the commitment duration expires, in the ISO8601 format in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`). You can't decrease the instance count or cancel the Capacity Reservation before this date and time.

Type: Timestamp

Required: No

**committedInstanceCount**

The instance capacity that you committed to when you requested the future-dated Capacity Reservation.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationConfiguration

Describes the configuration of a Capacity Reservation.

## Contents

**instanceCount**

The number of instances in the Capacity Reservation.

Type: Integer

Required: No

**reservationState**

The current state of the Capacity Reservation.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationFleet

Information about a Capacity Reservation Fleet.

## Contents

**allocationStrategy**

The strategy used by the Capacity Reservation Fleet to determine which of the specified instance types to use. For more information, see For more information, see Allocation strategy in the *Amazon EC2 User Guide*.

Type: String

Required: No

**capacityReservationFleetArn**

The ARN of the Capacity Reservation Fleet.

Type: String

Required: No

**capacityReservationFleetId**

The ID of the Capacity Reservation Fleet.

Type: String

Required: No

**createTime**

The date and time at which the Capacity Reservation Fleet was created.

Type: Timestamp

Required: No

**endDate**

The date and time at which the Capacity Reservation Fleet expires.

Type: Timestamp

Required: No

**instanceMatchCriteria**

Indicates the type of instance launches that the Capacity Reservation Fleet accepts. All Capacity Reservations in the Fleet inherit this instance matching criteria.

Currently, Capacity Reservation Fleets support `open` instance matching criteria only. This means that instances that have matching attributes (instance type, platform, and Availability Zone) run in the Capacity Reservations automatically. Instances do not need to explicitly target a Capacity Reservation Fleet to use its reserved capacity.

Type: String

Valid Values: `open`

Required: No

**InstanceTypeSpecificationSet.N**

Information about the instance types for which to reserve the capacity.

Type: Array of FleetCapacityReservation objects

Required: No

**state**

The state of the Capacity Reservation Fleet. Possible states include:

- `submitted` - The Capacity Reservation Fleet request has been submitted and Amazon Elastic Compute Cloud is preparing to create the Capacity Reservations.
- `modifying` - The Capacity Reservation Fleet is being modified. The Fleet remains in this state until the modification is complete.
- `active` - The Capacity Reservation Fleet has fulfilled its total target capacity and it is attempting to maintain this capacity. The Fleet remains in this state until it is modified or deleted.
- `partially_fulfilled` - The Capacity Reservation Fleet has partially fulfilled its total target capacity. There is insufficient Amazon EC2 to fulfill the total target capacity. The Fleet is attempting to asynchronously fulfill its total target capacity.
- `expiring` - The Capacity Reservation Fleet has reach its end date and it is in the process of expiring. One or more of its Capacity reservations might still be active.

- `expired` - The Capacity Reservation Fleet has reach its end date. The Fleet and its Capacity Reservations are expired. The Fleet can't create new Capacity Reservations.
- `cancelling` - The Capacity Reservation Fleet is in the process of being cancelled. One or more of its Capacity reservations might still be active.
- `cancelled` - The Capacity Reservation Fleet has been manually cancelled. The Fleet and its Capacity Reservations are cancelled and the Fleet can't create new Capacity Reservations.
- `failed` - The Capacity Reservation Fleet failed to reserve capacity for the specified instance types.

Type: String

Valid Values: `submitted | modifying | active | partially_fulfilled | expiring | expired | cancelling | cancelled | failed`

Required: No

**TagSet.N**

The tags assigned to the Capacity Reservation Fleet.

Type: Array of Tag objects

Required: No

**tenancy**

The tenancy of the Capacity Reservation Fleet. Tenancies include:

- `default` - The Capacity Reservation Fleet is created on hardware that is shared with other AWS accounts.
- `dedicated` - The Capacity Reservation Fleet is created on single-tenant hardware that is dedicated to a single AWS account.

Type: String

Valid Values: `default`

Required: No

**totalFulfilledCapacity**

The capacity units that have been fulfilled.

Type: Double

Required: No

**totalTargetCapacity**

The total number of capacity units for which the Capacity Reservation Fleet reserves capacity. For more information, see Total target capacity in the *Amazon EC2 User Guide*.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationFleetCancellationState

Describes a Capacity Reservation Fleet that was successfully cancelled.

## Contents

**capacityReservationFleetId**

The ID of the Capacity Reservation Fleet that was successfully cancelled.

Type: String

Required: No

**currentFleetState**

The current state of the Capacity Reservation Fleet.

Type: String

Valid Values: `submitted | modifying | active | partially_fulfilled | expiring | expired | cancelling | cancelled | failed`

Required: No

**previousFleetState**

The previous state of the Capacity Reservation Fleet.

Type: String

Valid Values: `submitted | modifying | active | partially_fulfilled | expiring | expired | cancelling | cancelled | failed`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationGroup

Describes a resource group to which a Capacity Reservation has been added.

## Contents

**groupArn**

The ARN of the resource group.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the resource group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationInfo

Information about a Capacity Reservation.

## Contents

**availabilityZone**

The Availability Zone for the Capacity Reservation.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**instanceType**

The instance type for the Capacity Reservation.

Type: String

Required: No

**tenancy**

The tenancy of the Capacity Reservation.

Type: String

Valid Values: `default | dedicated`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationOptions

Describes the strategy for using unused Capacity Reservations for fulfilling On-Demand capacity.

> **Note**
>
> This strategy can only be used if the EC2 Fleet is of type `instant`.

For more information about Capacity Reservations, see On-Demand Capacity Reservations in the *Amazon EC2 User Guide*. For examples of using Capacity Reservations in an EC2 Fleet, see EC2 Fleet example configurations in the *Amazon EC2 User Guide*.

## Contents

**usageStrategy**

Indicates whether to use unused Capacity Reservations for fulfilling On-Demand capacity.

If you specify `use-capacity-reservations-first`, the fleet uses unused Capacity Reservations to fulfill On-Demand capacity up to the target On-Demand capacity. If multiple instance pools have unused Capacity Reservations, the On-Demand allocation strategy (`lowest-price` or `prioritized`) is applied. If the number of unused Capacity Reservations is less than the On-Demand target capacity, the remaining On-Demand target capacity is launched according to the On-Demand allocation strategy (`lowest-price` or `prioritized`).

If you do not specify a value, the fleet fulfils the On-Demand capacity according to the chosen On-Demand allocation strategy.

Type: String

Valid Values: `use-capacity-reservations-first`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationOptionsRequest

Describes the strategy for using unused Capacity Reservations for fulfilling On-Demand capacity.

> **Note**
>
> This strategy can only be used if the EC2 Fleet is of type `instant`.

For more information about Capacity Reservations, see On-Demand Capacity Reservations in the *Amazon EC2 User Guide*. For examples of using Capacity Reservations in an EC2 Fleet, see EC2 Fleet example configurations in the *Amazon EC2 User Guide*.

## Contents

**UsageStrategy**

Indicates whether to use unused Capacity Reservations for fulfilling On-Demand capacity.

If you specify `use-capacity-reservations-first`, the fleet uses unused Capacity Reservations to fulfill On-Demand capacity up to the target On-Demand capacity. If multiple instance pools have unused Capacity Reservations, the On-Demand allocation strategy (`lowest-price` or `prioritized`) is applied. If the number of unused Capacity Reservations is less than the On-Demand target capacity, the remaining On-Demand target capacity is launched according to the On-Demand allocation strategy (`lowest-price` or `prioritized`).

If you do not specify a value, the fleet fulfils the On-Demand capacity according to the chosen On-Demand allocation strategy.

Type: String

Valid Values: `use-capacity-reservations-first`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationSpecification

Describes an instance's Capacity Reservation targeting option.

Use the `CapacityReservationPreference` parameter to configure the instance to run as an On-Demand Instance, to run in any `open` Capacity Reservation that has matching attributes, or to run only in a Capacity Reservation or Capacity Reservation group. Use the `CapacityReservationTarget` parameter to explicitly target a specific Capacity Reservation or a Capacity Reservation group.

You can only specify `CapacityReservationPreference` and `CapacityReservationTarget` if the `CapacityReservationPreference` is `capacity-reservations-only`.

## Contents

**CapacityReservationPreference**

Indicates the instance's Capacity Reservation preferences. Possible preferences include:

- `capacity-reservations-only` - The instance will only run in a Capacity Reservation or Capacity Reservation group. If capacity isn't available, the instance will fail to launch.
- `open` - The instance can run in any `open` Capacity Reservation that has matching attributes (instance type, platform, Availability Zone, and tenancy). If capacity isn't available, the instance runs as an On-Demand Instance.
- `none` - The instance doesn't run in a Capacity Reservation even if one is available. The instance runs as an On-Demand Instance.

Type: String

Valid Values: `capacity-reservations-only | open | none`

Required: No

**CapacityReservationTarget**

Information about the target Capacity Reservation or Capacity Reservation group.

Type: CapacityReservationTarget object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationSpecificationResponse

Describes the instance's Capacity Reservation targeting preferences. The action returns the `capacityReservationPreference` response element if the instance is configured to run in On-Demand capacity, or if it is configured in run in any `open` Capacity Reservation that has matching attributes (instance type, platform, Availability Zone). The action returns the `capacityReservationTarget` response element if the instance explicily targets a specific Capacity Reservation or Capacity Reservation group.

## Contents

**capacityReservationPreference**

Describes the instance's Capacity Reservation preferences. Possible preferences include:

- `open` - The instance can run in any `open` Capacity Reservation that has matching attributes (instance type, platform, Availability Zone).
- `none` - The instance avoids running in a Capacity Reservation even if one is available. The instance runs in On-Demand capacity.

Type: String

Valid Values: `capacity-reservations-only | open | none`

Required: No

**capacityReservationTarget**

Information about the targeted Capacity Reservation or Capacity Reservation group.

Type: CapacityReservationTargetResponse object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# CapacityReservationStatus

Describes the availability of capacity for a Capacity Reservation.

## Contents

**capacityReservationId**

The ID of the Capacity Reservation.

Type: String

Required: No

**totalAvailableCapacity**

The remaining capacity. Indicates the amount of resources that can be launched into the Capacity Reservation.

Type: Integer

Required: No

**totalCapacity**

The combined amount of `Available` and `Unavailable` capacity in the Capacity Reservation.

Type: Integer

Required: No

**totalUnavailableCapacity**

The used capacity. Indicates that the capacity is in use by resources that are running in the Capacity Reservation.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationTarget

Describes a target Capacity Reservation or Capacity Reservation group.

## Contents

**CapacityReservationId**

The ID of the Capacity Reservation in which to run the instance.

Type: String

Required: No

**CapacityReservationResourceGroupArn**

The ARN of the Capacity Reservation resource group in which to run the instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationTargetResponse

Describes a target Capacity Reservation or Capacity Reservation group.

## Contents

**capacityReservationId**

The ID of the targeted Capacity Reservation.

Type: String

Required: No

**capacityReservationResourceGroupArn**

The ARN of the targeted Capacity Reservation group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CapacityReservationTopology

Information about the Capacity Reservation topology.

## Contents

**availabilityZone**

The name of the Availability Zone or Local Zone that the Capacity Reservation is in.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone or Local Zone that the Capacity Reservation is in.

Type: String

Required: No

**capacityBlockId**

The ID of the Capacity Block. This parameter is only supported for UltraServer instances and identifies instances within the UltraServer domain.

Type: String

Required: No

**capacityReservationId**

The ID of the Capacity Reservation.

Type: String

Required: No

**groupName**

The name of the placement group that the Capacity Reservation is in.

Type: String

Required: No

**instanceType**

The instance type.

Type: String

Required: No

**NetworkNodeSet.N**

The network nodes. The nodes are hashed based on your account. Capacity Reservations from different accounts running under the same server will return a different hashed list of strings.

The value is `null` or empty if:

- The instance type is not supported.
- The Capacity Reservation is in a state other than `active` or `pending`.

Type: Array of strings

Required: No

**state**

The current state of the Capacity Reservation. For the list of possible states, see DescribeCapacityReservations.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CarrierGateway

Describes a carrier gateway.

## Contents

**carrierGatewayId**

The ID of the carrier gateway.

Type: String

Required: No

**ownerId**

The AWS account ID of the owner of the carrier gateway.

Type: String

Required: No

**state**

The state of the carrier gateway.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**TagSet.N**

The tags assigned to the carrier gateway.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC associated with the carrier gateway.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CertificateAuthentication

Information about the client certificate used for authentication.

## Contents

**clientRootCertificateChain**

The ARN of the client certificate.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CertificateAuthenticationRequest

Information about the client certificate to be used for authentication.

## Contents

**ClientRootCertificateChainArn**

The ARN of the client certificate. The certificate must be signed by a certificate authority (CA) and it must be provisioned in AWS Certificate Manager (ACM).

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CidrAuthorizationContext

Provides authorization for Amazon to bring a specific IP address range to a specific AWS account using bring your own IP addresses (BYOIP). For more information, see Configuring your BYOIP address range in the *Amazon EC2 User Guide*.

## Contents

**Message**

The plain-text authorization message for the prefix and account.

Type: String

Required: Yes

**Signature**

The signed authorization message for the prefix and account.

Type: String

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CidrBlock

Describes an IPv4 CIDR block.

## Contents

**cidrBlock**

The IPv4 CIDR block.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClassicLinkDnsSupport

> **Note**
>
> Deprecated.

Describes the ClassicLink DNS support status of a VPC.

## Contents

**classicLinkDnsSupported**

Indicates whether ClassicLink DNS support is enabled for the VPC.

Type: Boolean

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClassicLinkInstance

> **Note**
>
> Deprecated.

Describes a linked EC2-Classic instance.

## Contents

**GroupSet.N**

The security groups.

Type: Array of GroupIdentifier objects

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the instance.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClassicLoadBalancer

Describes a Classic Load Balancer.

## Contents

**Name** (request), **name** (response)

The name of the load balancer.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClassicLoadBalancersConfig

Describes the Classic Load Balancers to attach to a Spot Fleet. Spot Fleet registers the running Spot Instances with these Classic Load Balancers.

## Contents

**ClassicLoadBalancers.N**

One or more Classic Load Balancers.

Type: Array of ClassicLoadBalancer objects

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientCertificateRevocationListStatus

Describes the state of a client certificate revocation list.

## Contents

**code**

The state of the client certificate revocation list.

Type: String

Valid Values: `pending | active`

Required: No

**message**

A message about the status of the client certificate revocation list, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientConnectOptions

The options for managing connection authorization for new client connections.

## Contents

**Enabled**

Indicates whether client connect options are enabled. The default is `false` (not enabled).

Type: Boolean

Required: No

**LambdaFunctionArn**

The Amazon Resource Name (ARN) of the Lambda function used for connection authorization.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientConnectResponseOptions

The options for managing connection authorization for new client connections.

## Contents

**enabled**

Indicates whether client connect options are enabled.

Type: Boolean

Required: No

**lambdaFunctionArn**

The Amazon Resource Name (ARN) of the Lambda function used for connection authorization.

Type: String

Required: No

**status**

The status of any updates to the client connect options.

Type: ClientVpnEndpointAttributeStatus object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientData

Describes the client-specific data.

## Contents

**Comment**

A user-defined comment about the disk upload.

Type: String

Required: No

**UploadEnd**

The time that the disk upload ends.

Type: Timestamp

Required: No

**UploadSize**

The size of the uploaded disk image, in GiB.

Type: Double

Required: No

**UploadStart**

The time that the disk upload starts.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientLoginBannerOptions

Options for enabling a customizable text banner that will be displayed on AWS provided clients when a VPN session is established.

## Contents

**BannerText**

Customizable text that will be displayed in a banner on AWS provided clients when a VPN session is established. UTF-8 encoded characters only. Maximum of 1400 characters.

Type: String

Required: No

**Enabled**

Enable or disable a customizable text banner that will be displayed on AWS provided clients when a VPN session is established.

Valid values: `true | false`

Default value: `false`

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientLoginBannerResponseOptions

Current state of options for customizable text banner that will be displayed on AWS provided clients when a VPN session is established.

## Contents

**bannerText**

Customizable text that will be displayed in a banner on AWS provided clients when a VPN session is established. UTF-8 encoded characters only. Maximum of 1400 characters.

Type: String

Required: No

**enabled**

Current state of text banner feature.

Valid values: `true | false`

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientRouteEnforcementOptions

Client Route Enforcement is a feature of Client VPN that helps enforce administrator defined routes on devices connected through the VPN. This feature helps improve your security posture by ensuring that network traffic originating from a connected client is not inadvertently sent outside the VPN tunnel.

Client Route Enforcement works by monitoring the route table of a connected device for routing policy changes to the VPN connection. If the feature detects any VPN routing policy modifications, it will automatically force an update to the route table, reverting it back to the expected route configurations.

## Contents

**Enforced**

Enable or disable Client Route Enforcement. The state can either be `true` (enabled) or `false` (disabled). The default is `false`.

Valid values: `true | false`

Default value: `false`

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientRouteEnforcementResponseOptions

The current status of Client Route Enforcement.

## Contents

**enforced**

Status of the client route enforcement feature, indicating whether Client Route Enforcement is `true` (enabled) or `false` (disabled).

Valid values: `true | false`

Default value: `false`

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnAuthentication

Describes the authentication methods used by a Client VPN endpoint. For more information, see Authentication in the *AWS Client VPN Administrator Guide*.

## Contents

**activeDirectory**

Information about the Active Directory, if applicable.

Type: DirectoryServiceAuthentication object

Required: No

**federatedAuthentication**

Information about the IAM SAML identity provider, if applicable.

Type: FederatedAuthentication object

Required: No

**mutualAuthentication**

Information about the authentication certificates, if applicable.

Type: CertificateAuthentication object

Required: No

**type**

The authentication type used.

Type: String

Valid Values: `certificate-authentication | directory-service-authentication | federated-authentication`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnAuthenticationRequest

Describes the authentication method to be used by a Client VPN endpoint. For more information, see Authentication in the *AWS Client VPN Administrator Guide*.

## Contents

**ActiveDirectory**

Information about the Active Directory to be used, if applicable. You must provide this information if **Type** is `directory-service-authentication`.

Type: DirectoryServiceAuthenticationRequest object

Required: No

**FederatedAuthentication**

Information about the IAM SAML identity provider to be used, if applicable. You must provide this information if **Type** is `federated-authentication`.

Type: FederatedAuthenticationRequest object

Required: No

**MutualAuthentication**

Information about the authentication certificates to be used, if applicable. You must provide this information if **Type** is `certificate-authentication`.

Type: CertificateAuthenticationRequest object

Required: No

**Type**

The type of client authentication to be used.

Type: String

Valid Values: `certificate-authentication | directory-service-authentication | federated-authentication`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnAuthorizationRuleStatus

Describes the state of an authorization rule.

## Contents

**code**

The state of the authorization rule.

Type: String

Valid Values: `authorizing | active | failed | revoking`

Required: No

**message**

A message about the status of the authorization rule, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnConnection

Describes a client connection.

## Contents

**clientIp**

The IP address of the client.

Type: String

Required: No

**clientIpv6Address**

The IPv6 address assigned to the client connection when using a dual-stack Client VPN endpoint. This field is only populated when the endpoint is configured for dual-stack addressing, and the client is using IPv6 for connectivity.

Type: String

Required: No

**clientVpnEndpointId**

The ID of the Client VPN endpoint to which the client is connected.

Type: String

Required: No

**commonName**

The common name associated with the client. This is either the name of the client certificate, or the Active Directory user name.

Type: String

Required: No

**connectionEndTime**

The date and time the client connection was terminated.

Type: String

Required: No

**connectionEstablishedTime**

The date and time the client connection was established.

Type: String

Required: No

**connectionId**

The ID of the client connection.

Type: String

Required: No

**egressBytes**

The number of bytes received by the client.

Type: String

Required: No

**egressPackets**

The number of packets received by the client.

Type: String

Required: No

**ingressBytes**

The number of bytes sent by the client.

Type: String

Required: No

**ingressPackets**

The number of packets sent by the client.

Type: String

Required: No

**PostureComplianceStatusSet.N**

The statuses returned by the client connect handler for posture compliance, if applicable.

Type: Array of strings

Required: No

**status**

The current state of the client connection.

Type: ClientVpnConnectionStatus object

Required: No

**timestamp**

The current date and time.

Type: String

Required: No

**username**

The username of the client who established the client connection. This information is only provided if Active Directory client authentication is used.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# ClientVpnConnectionStatus

Describes the status of a client connection.

## Contents

**code**

The state of the client connection.

Type: String

Valid Values: `active | failed-to-terminate | terminating | terminated`

Required: No

**message**

A message about the status of the client connection, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnEndpoint

Describes a Client VPN endpoint.

## Contents

**AssociatedTargetNetwork.N**

*This member has been deprecated.*

Information about the associated target networks. A target network is a subnet in a VPC.

Type: Array of AssociatedTargetNetwork objects

Required: No

**AuthenticationOptions.N**

Information about the authentication method used by the Client VPN endpoint.

Type: Array of ClientVpnAuthentication objects

Required: No

**clientCidrBlock**

The IPv4 address range, in CIDR notation, from which client IP addresses are assigned.

Type: String

Required: No

**clientConnectOptions**

The options for managing connection authorization for new client connections.

Type: ClientConnectResponseOptions object

Required: No

**clientLoginBannerOptions**

Options for enabling a customizable text banner that will be displayed on AWS provided clients when a VPN session is established.

Type: ClientLoginBannerResponseOptions object

Required: No

**clientRouteEnforcementOptions**

Client route enforcement is a feature of the Client VPN service that helps enforce administrator defined routes on devices connected through the VPN. T his feature helps improve your security posture by ensuring that network traffic originating from a connected client is not inadvertently sent outside the VPN tunnel.

Client route enforcement works by monitoring the route table of a connected device for routing policy changes to the VPN connection. If the feature detects any VPN routing policy modifications, it will automatically force an update to the route table, reverting it back to the expected route configurations.

Type: ClientRouteEnforcementResponseOptions object

Required: No

**clientVpnEndpointId**

The ID of the Client VPN endpoint.

Type: String

Required: No

**connectionLogOptions**

Information about the client connection logging options for the Client VPN endpoint.

Type: ConnectionLogResponseOptions object

Required: No

**creationTime**

The date and time the Client VPN endpoint was created.

Type: String

Required: No

**deletionTime**

The date and time the Client VPN endpoint was deleted, if applicable.

Type: String

Required: No

**description**

A brief description of the endpoint.

Type: String

Required: No

**disconnectOnSessionTimeout**

Indicates whether the client VPN session is disconnected after the maximum `sessionTimeoutHours` is reached. If `true`, users are prompted to reconnect client VPN. If `false`, client VPN attempts to reconnect automatically. The default value is `true`.

Type: Boolean

Required: No

**dnsName**

The DNS name to be used by clients when connecting to the Client VPN endpoint.

Type: String

Required: No

**DnsServer.N**

Information about the DNS servers to be used for DNS resolution.

Type: Array of strings

Required: No

**endpointIpAddressType**

The IP address type of the Client VPN endpoint. Possible values are `ipv4` for IPv4 addressing only, `ipv6` for IPv6 addressing only, or `dual-stack` for both IPv4 and IPv6 addressing.

Type: String

Valid Values: `ipv4 | ipv6 | dual-stack`

Required: No

**SecurityGroupIdSet.N**

The IDs of the security groups for the target network.

Type: Array of strings

Required: No

**selfServicePortalUrl**

The URL of the self-service portal.

Type: String

Required: No

**serverCertificateArn**

The ARN of the server certificate.

Type: String

Required: No

**sessionTimeoutHours**

The maximum VPN session duration time in hours.

Valid values: `8 | 10 | 12 | 24`

Default value: `24`

Type: Integer

Required: No

**splitTunnel**

Indicates whether split-tunnel is enabled in the AWS Client VPN endpoint.

For information about split-tunnel VPN endpoints, see Split-Tunnel AWS Client VPN endpoint in the *AWS Client VPN Administrator Guide*.

Type: Boolean

Required: No

**status**

The current state of the Client VPN endpoint.

Type: ClientVpnEndpointStatus object

Required: No

**TagSet.N**

Any tags assigned to the Client VPN endpoint.

Type: Array of Tag objects

Required: No

**trafficIpAddressType**

The IP address type of the Client VPN endpoint. Possible values are either `ipv4` for IPv4 addressing only, `ipv6` for IPv6 addressing only, or `dual-stack` for both IPv4 and IPv6 addressing.

Type: String

Valid Values: `ipv4 | ipv6 | dual-stack`

Required: No

**transitGatewayConfiguration**

The Transit Gateway configuration for the Client VPN endpoint.

Type: TransitGatewayConfigurationDescribeEndpointStructure object

Required: No

**transportProtocol**

The transport protocol used by the Client VPN endpoint.

Type: String

Valid Values: `tcp | udp`

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

**vpnPort**

The port number for the Client VPN endpoint.

Type: Integer

Required: No

**vpnProtocol**

The protocol used by the VPN session.

Type: String

Valid Values: openvpn

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnEndpointAttributeStatus

Describes the status of the Client VPN endpoint attribute.

## Contents

**code**

The status code.

Type: String

Valid Values: `applying | applied`

Required: No

**message**

The status message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnEndpointStatus

Describes the state of a Client VPN endpoint.

## Contents

**code**

The state of the Client VPN endpoint. Possible states include:

- `pending-associate` - The Client VPN endpoint has been created but no target networks have been associated. The Client VPN endpoint cannot accept connections.
- `available` - The Client VPN endpoint has been created and a target network has been associated. The Client VPN endpoint can accept connections.
- `deleting` - The Client VPN endpoint is being deleted. The Client VPN endpoint cannot accept connections.
- `deleted` - The Client VPN endpoint has been deleted. The Client VPN endpoint cannot accept connections.
- `pending` - The Client VPN endpoint has been created with a Transit Gateway configuration and is waiting for the Transit Gateway attachment to be accepted. The Client VPN endpoint cannot accept connections.

Type: String

Valid Values: `pending-associate | available | deleting | deleted | pending`

Required: No

**message**

A message about the status of the Client VPN endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnRoute

Information about a Client VPN endpoint route.

## Contents

**clientVpnEndpointId**

The ID of the Client VPN endpoint with which the route is associated.

Type: String

Required: No

**description**

A brief description of the route.

Type: String

Required: No

**destinationCidr**

The IPv4 address range, in CIDR notation, of the route destination.

Type: String

Required: No

**origin**

Indicates how the route was associated with the Client VPN endpoint. `associate` indicates that the route was automatically added when the target network was associated with the Client VPN endpoint. `add-route` indicates that the route was manually added using the **CreateClientVpnRoute** action.

Type: String

Required: No

**status**

The current state of the route.

Type: ClientVpnRouteStatus object

Required: No

**targetSubnet**

The ID of the subnet through which traffic is routed.

Type: String

Required: No

**transitGatewayAttachmentId**

The ID of the Transit Gateway attachment, if the route targets a Transit Gateway.

Type: String

Required: No

**type**

The route type.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ClientVpnRouteStatus

Describes the state of a Client VPN endpoint route.

## Contents

**code**

The state of the Client VPN endpoint route.

Type: String

Valid Values: `creating | active | failed | deleting`

Required: No

**message**

A message about the status of the Client VPN endpoint route, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CloudWatchLogOptions

Options for sending VPN tunnel logs to CloudWatch.

## Contents

**bgpLogEnabled**

Indicates whether Border Gateway Protocol (BGP) logging is enabled for the VPN connection. Default value is `False`.

Valid values: `True` | `False`

Type: Boolean

Required: No

**bgpLogGroupArn**

The Amazon Resource Name (ARN) of the CloudWatch log group for BGP logs.

Type: String

Required: No

**bgpLogOutputFormat**

The output format for BGP logs sent to CloudWatch. Default format is `json`.

Valid values: `json` | `text`

Type: String

Required: No

**logEnabled**

Status of VPN tunnel logging feature. Default value is `False`.

Valid values: `True` | `False`

Type: Boolean

Required: No

**logGroupArn**

The Amazon Resource Name (ARN) of the CloudWatch log group to send logs to.

Type: String

Required: No

**logOutputFormat**

Configured log format. Default format is `json`.

Valid values: `json` | `text`

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CloudWatchLogOptionsSpecification

Options for sending VPN tunnel logs to CloudWatch.

## Contents

**BgpLogEnabled**

Specifies whether to enable BGP logging for the VPN connection. Default value is `False`.

Valid values: `True` | `False`

Type: Boolean

Required: No

**BgpLogGroupArn**

The Amazon Resource Name (ARN) of the CloudWatch log group where BGP logs will be sent.

Type: String

Required: No

**BgpLogOutputFormat**

The desired output format for BGP logs to be sent to CloudWatch. Default format is `json`.

Valid values: `json` | `text`

Type: String

Required: No

**LogEnabled**

Enable or disable VPN tunnel logging feature. Default value is `False`.

Valid values: `True` | `False`

Type: Boolean

Required: No

**LogGroupArn**

The Amazon Resource Name (ARN) of the CloudWatch log group to send logs to.

Type: String

Required: No

**LogOutputFormat**

Set log format. Default format is `json`.

Valid values: `json` | `text`

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CoipAddressUsage

Describes address usage for a customer-owned address pool.

## Contents

**allocationId**

The allocation ID of the address.

Type: String

Required: No

**awsAccountId**

The AWS account ID.

Type: String

Required: No

**awsService**

The AWS service.

Type: String

Required: No

**coIp**

The customer-owned IP address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CoipCidr

Information about a customer-owned IP address range.

## Contents

**cidr**

An address range in a customer-owned IP address space.

Type: String

Required: No

**coipPoolId**

The ID of the address pool.

Type: String

Required: No

**localGatewayRouteTableId**

The ID of the local gateway route table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CoipPool

Describes a customer-owned address pool.

## Contents

**localGatewayRouteTableId**

The ID of the local gateway route table.

Type: String

Required: No

**poolArn**

The ARN of the address pool.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**PoolCidrSet.N**

The address ranges of the address pool.

Type: Array of strings

Required: No

**poolId**

The ID of the address pool.

Type: String

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ConnectionLogOptions

Describes the client connection logging options for the Client VPN endpoint.

## Contents

**CloudwatchLogGroup**

The name of the CloudWatch Logs log group. Required if connection logging is enabled.

Type: String

Required: No

**CloudwatchLogStream**

The name of the CloudWatch Logs log stream to which the connection data is published.

Type: String

Required: No

**Enabled**

Indicates whether connection logging is enabled.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ConnectionLogResponseOptions

Information about the client connection logging options for a Client VPN endpoint.

## Contents

**CloudwatchLogGroup**

The name of the Amazon CloudWatch Logs log group to which connection logging data is published.

Type: String

Required: No

**CloudwatchLogStream**

The name of the Amazon CloudWatch Logs log stream to which connection logging data is published.

Type: String

Required: No

**Enabled**

Indicates whether client connection logging is enabled for the Client VPN endpoint.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ConnectionNotification

Describes a connection notification for a VPC endpoint or VPC endpoint service.

## Contents

**ConnectionEvents.N**

The events for the notification. Valid values are `Accept`, `Connect`, `Delete`, and `Reject`.

Type: Array of strings

Required: No

**connectionNotificationArn**

The ARN of the SNS topic for the notification.

Type: String

Required: No

**connectionNotificationId**

The ID of the notification.

Type: String

Required: No

**connectionNotificationState**

The state of the notification.

Type: String

Valid Values: `Enabled | Disabled`

Required: No

**connectionNotificationType**

The type of notification.

Type: String

Valid Values: `Topic`

Required: No

**serviceId**

The ID of the endpoint service.

Type: String

Required: No

**serviceRegion**

The Region for the endpoint service.

Type: String

Required: No

**vpcEndpointId**

The ID of the VPC endpoint.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ConnectionTrackingConfiguration

A security group connection tracking configuration that enables you to set the idle timeout for connection tracking on an Elastic network interface. For more information, see Connection tracking timeouts in the *Amazon EC2 User Guide*.

## Contents

**tcpEstablishedTimeout**

Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 350 seconds for Nitro v6 instance types (excluding P6e-GB200); 432000 seconds for all other instance types (including P6e-GB200). Recommended: Less than 432000 seconds.

Type: Integer

Required: No

**udpStreamTimeout**

Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

Type: Integer

Required: No

**udpTimeout**

Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ConnectionTrackingSpecification

A security group connection tracking specification that enables you to set the idle timeout for connection tracking on an Elastic network interface. For more information, see Connection tracking timeouts in the *Amazon EC2 User Guide*.

## Contents

**tcpEstablishedTimeout**

Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 350 seconds for Nitro v6 instance types (excluding P6e-GB200); 432000 seconds for all other instance types (including P6e-GB200). Recommended: Less than 432000 seconds.

Type: Integer

Required: No

**udpStreamTimeout**

Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

Type: Integer

Required: No

**udpTimeout**

Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ConnectionTrackingSpecificationRequest

A security group connection tracking specification request that enables you to set the idle timeout for connection tracking on an Elastic network interface. For more information, see Connection tracking timeouts in the *Amazon EC2 User Guide*.

## Contents

**TcpEstablishedTimeout** (request), **TcpEstablishedTimeout** (response)

Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 350 seconds for Nitro v6 instance types (excluding P6e-GB200); 432000 seconds for all other instance types (including P6e-GB200). Recommended: Less than 432000 seconds.

Type: Integer

Required: No

**UdpStreamTimeout** (request), **UdpStreamTimeout** (response)

Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

Type: Integer

Required: No

**UdpTimeout** (request), **UdpTimeout** (response)

Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ConnectionTrackingSpecificationResponse

A security group connection tracking specification response that enables you to set the idle timeout for connection tracking on an Elastic network interface. For more information, see Connection tracking timeouts in the *Amazon EC2 User Guide*.

## Contents

**tcpEstablishedTimeout**

Timeout (in seconds) for idle TCP connections in an established state. Min: 60 seconds. Max: 432000 seconds (5 days). Default: 350 seconds for Nitro v6 instance types (excluding P6e-GB200); 432000 seconds for all other instance types (including P6e-GB200). Recommended: Less than 432000 seconds.

Type: Integer

Required: No

**udpStreamTimeout**

Timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction. Min: 60 seconds. Max: 180 seconds (3 minutes). Default: 180 seconds.

Type: Integer

Required: No

**udpTimeout**

Timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction. Min: 30 seconds. Max: 60 seconds. Default: 30 seconds.

Type: Integer

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ConversionTask

Describes a conversion task.

## Contents

**conversionTaskId**

The ID of the conversion task.

Type: String

Required: No

**expirationTime**

The time when the task expires. If the upload isn't complete before the expiration time, we automatically cancel the task.

Type: String

Required: No

**importInstance**

If the task is for importing an instance, this contains information about the import instance task.

Type: ImportInstanceTaskDetails object

Required: No

**importVolume**

If the task is for importing a volume, this contains information about the import volume task.

Type: ImportVolumeTaskDetails object

Required: No

**state**

The state of the conversion task.

Type: String

Valid Values: `active | cancelling | cancelled | completed`

Required: No

**statusMessage**

The status message related to the conversion task.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the task.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CpuOptions

The CPU options for the instance.

## Contents

**amdSevSnp**

Indicates whether the instance is enabled for AMD SEV-SNP. For more information, see AMD SEV-SNP.

Type: String

Valid Values: `enabled | disabled`

Required: No

**coreCount**

The number of CPU cores for the instance.

Type: Integer

Required: No

**nestedVirtualization**

Indicates whether the instance is enabled for nested virtualization.

Type: String

Valid Values: `enabled | disabled`

Required: No

**threadsPerCore**

The number of threads per CPU core.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CpuOptionsRequest

The CPU options for the instance. Both the core count and threads per core must be specified in the request.

## Contents

**AmdSevSnp**

Indicates whether to enable the instance for AMD SEV-SNP. AMD SEV-SNP is supported with M6a, R6a, and C6a instance types only. For more information, see AMD SEV-SNP.

Type: String

Valid Values: `enabled | disabled`

Required: No

**CoreCount**

The number of CPU cores for the instance.

Type: Integer

Required: No

**NestedVirtualization**

Indicates whether to enable the instance for nested virtualization. Nested virtualization is supported only on 8th generation Intel-based instance types (c8i, m8i, r8i, and their flex variants). When nested virtualization is enabled, Virtual Secure Mode (VSM) is automatically disabled for the instance.

Type: String

Valid Values: `enabled | disabled`

Required: No

**ThreadsPerCore**

The number of threads per CPU core. To disable multithreading for the instance, specify a value of 1. Otherwise, specify the default value of 2.

Type: Integer

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CpuPerformanceFactor

The CPU performance to consider, using an instance family as the baseline reference.

## Contents

**ReferenceSet.N**

Specify an instance family to use as the baseline reference for CPU performance. All instance types that match your specified attributes will be compared against the CPU performance of the referenced instance family, regardless of CPU manufacturer or architecture differences.

> **Note**
>
> Currently, only one instance family can be specified in the list.

Type: Array of PerformanceFactorReference objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CpuPerformanceFactorRequest

The CPU performance to consider, using an instance family as the baseline reference.

## Contents

**Reference.N**

Specify an instance family to use as the baseline reference for CPU performance. All instance types that match your specified attributes will be compared against the CPU performance of the referenced instance family, regardless of CPU manufacturer or architecture differences.

> **Note**
>
> Currently, only one instance family can be specified in the list.

Type: Array of PerformanceFactorReferenceRequest objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateFleetError

Describes the instances that could not be launched by the fleet.

## Contents

**errorCode**

The error code that indicates why the instance could not be launched. For more information about error codes, see Error codes.

Type: String

Required: No

**errorMessage**

The error message that describes why the instance could not be launched. For more information about error messages, see Error codes.

Type: String

Required: No

**launchTemplateAndOverrides**

The launch templates and overrides that were used for launching the instances. The values that you specify in the Overrides replace the values in the launch template.

Type: LaunchTemplateAndOverridesResponse object

Required: No

**lifecycle**

Indicates if the instance that could not be launched was a Spot, On-Demand, Capacity Block, or Interruptible Capacity Reservation instance.

Type: String

Valid Values: `spot | on-demand | interruptible-capacity-reservation`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateFleetInstance

Describes the instances that were launched by the fleet.

## Contents

**InstanceIds.N**

The IDs of the instances.

Type: Array of strings

Required: No

**instanceType**

The instance type.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge

Required: No

**launchTemplateAndOverrides**

The launch templates and overrides that were used for launching the instances. The values that you specify in the Overrides replace the values in the launch template.

Type: LaunchTemplateAndOverridesResponse object

Required: No

**lifecycle**

Indicates if the instance that was launched is a Spot, On-Demand, Capacity Block, or Interruptible Capacity Reservation instance.

Type: String

Valid Values: `spot | on-demand | interruptible-capacity-reservation`

Required: No

**platform**

The value is `windows` for Windows instances in an EC2 Fleet. Otherwise, the value is blank.

Type: String

Valid Values: `Windows`

Required: No

## See Also

- AWS SDK for Ruby V3

# CreateTransitGatewayConnectRequestOptions

The options for a Connect attachment.

## Contents

**Protocol**

The tunnel protocol.

Type: String

Valid Values: `gre`

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateTransitGatewayMulticastDomainRequestOptions

The options for the transit gateway multicast domain.

## Contents

**AutoAcceptSharedAssociations**

Indicates whether to automatically accept cross-account subnet associations that are associated with the transit gateway multicast domain.

Type: String

Valid Values: `enable | disable`

Required: No

**Igmpv2Support**

Specify whether to enable Internet Group Management Protocol (IGMP) version 2 for the transit gateway multicast domain.

Type: String

Valid Values: `enable | disable`

Required: No

**StaticSourcesSupport**

Specify whether to enable support for statically configuring multicast group sources for a domain.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateTransitGatewayPeeringAttachmentRequestOptions

Describes whether dynamic routing is enabled or disabled for the transit gateway peering request.

## Contents

**DynamicRouting**

Indicates whether dynamic routing is enabled or disabled.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateTransitGatewayVpcAttachmentRequestOptions

Describes the options for a VPC attachment.

## Contents

**ApplianceModeSupport**

Enable or disable support for appliance mode. If enabled, a traffic flow between a source and destination uses the same Availability Zone for the VPC attachment for the lifetime of that flow. The default is `disable`.

Type: String

Valid Values: `enable | disable`

Required: No

**DnsSupport**

Enable or disable DNS support. The default is `enable`.

Type: String

Valid Values: `enable | disable`

Required: No

**Ipv6Support**

Enable or disable IPv6 support. The default is `disable`.

Type: String

Valid Values: `enable | disable`

Required: No

**SecurityGroupReferencingSupport**

Enables you to reference a security group across VPCs attached to a transit gateway to simplify security group management.

This option is set to `enable` by default. However, at the transit gateway level the default is set to `disable`.

For more information about security group referencing, see Security group referencing in the *AWS Transit Gateways Guide*.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVerifiedAccessEndpointCidrOptions

Describes the CIDR options for a Verified Access endpoint.

## Contents

**Cidr**

The CIDR.

Type: String

Required: No

**PortRange.N**

The port ranges.

Type: Array of CreateVerifiedAccessEndpointPortRange objects

Required: No

**Protocol**

The protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

**SubnetId.N**

The IDs of the subnets.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVerifiedAccessEndpointEniOptions

Describes the network interface options when creating an AWS Verified Access endpoint using the `network-interface` type.

## Contents

**NetworkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**Port**

The IP port number.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**PortRange.N**

The port ranges.

Type: Array of CreateVerifiedAccessEndpointPortRange objects

Required: No

**Protocol**

The IP protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVerifiedAccessEndpointLoadBalancerOptions

Describes the load balancer options when creating an AWS Verified Access endpoint using the `load-balancer` type.

## Contents

**LoadBalancerArn**

The ARN of the load balancer.

Type: String

Required: No

**Port**

The IP port number.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**PortRange.N**

The port ranges.

Type: Array of CreateVerifiedAccessEndpointPortRange objects

Required: No

**Protocol**

The IP protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

**SubnetId.N**

The IDs of the subnets. You can specify only one subnet per Availability Zone.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVerifiedAccessEndpointPortRange

Describes the port range for a Verified Access endpoint.

## Contents

**FromPort**

The start of the port range.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**ToPort**

The end of the port range.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVerifiedAccessEndpointRdsOptions

Describes the RDS options for a Verified Access endpoint.

## Contents

**Port**

The port.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**Protocol**

The protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

**RdsDbClusterArn**

The ARN of the DB cluster.

Type: String

Required: No

**RdsDbInstanceArn**

The ARN of the RDS instance.

Type: String

Required: No

**RdsDbProxyArn**

The ARN of the RDS proxy.

Type: String

Required: No

**RdsEndpoint**

The RDS endpoint.

Type: String

Required: No

**SubnetId.N**

The IDs of the subnets. You can specify only one subnet per Availability Zone.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVerifiedAccessNativeApplicationOidcOptions

Describes the OpenID Connect (OIDC) options.

## Contents

**AuthorizationEndpoint**

The authorization endpoint of the IdP.

Type: String

Required: No

**ClientId**

The OAuth 2.0 client identifier.

Type: String

Required: No

**ClientSecret**

The OAuth 2.0 client secret.

Type: String

Required: No

**Issuer**

The OIDC issuer identifier of the IdP.

Type: String

Required: No

**PublicSigningKeyEndpoint**

The public signing key endpoint.

Type: String

Required: No

**Scope**

The set of user claims to be requested from the IdP.

Type: String

Required: No

**TokenEndpoint**

The token endpoint of the IdP.

Type: String

Required: No

**UserInfoEndpoint**

The user info endpoint of the IdP.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVerifiedAccessTrustProviderDeviceOptions

Describes the options when creating an AWS Verified Access trust provider using the `device` type.

## Contents

**PublicSigningKeyUrl**

The URL AWS Verified Access will use to verify the authenticity of the device tokens.

Type: String

Required: No

**TenantId**

The ID of the tenant application with the device-identity provider.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVerifiedAccessTrustProviderOidcOptions

Describes the options when creating an AWS Verified Access trust provider using the `user` type.

## Contents

**AuthorizationEndpoint**

The OIDC authorization endpoint.

Type: String

Required: No

**ClientId**

The client identifier.

Type: String

Required: No

**ClientSecret**

The client secret.

Type: String

Required: No

**Issuer**

The OIDC issuer.

Type: String

Required: No

**Scope**

OpenID Connect (OIDC) scopes are used by an application during authentication to authorize access to a user's details. Each scope returns a specific set of user attributes.

Type: String

Required: No

**TokenEndpoint**

The OIDC token endpoint.

Type: String

Required: No

**UserInfoEndpoint**

The OIDC user info endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVolumePermission

Describes the user or group to be added or removed from the list of create volume permissions for a volume.

## Contents

**Group** (request), **group** (response)

The group to be added or removed. The possible value is `all`.

Type: String

Valid Values: `all`

Required: No

**UserId** (request), **userId** (response)

The ID of the AWS account to be added or removed.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreateVolumePermissionModifications

Describes modifications to the list of create volume permissions for a volume.

## Contents

**Add.N**

Adds the specified AWS account ID or group to the list.

Type: Array of CreateVolumePermission objects

Required: No

**Remove.N**

Removes the specified AWS account ID or group from the list.

Type: Array of CreateVolumePermission objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreationDateCondition

The maximum age for allowed images.

## Contents

**maximumDaysSinceCreated**

The maximum number of days that have elapsed since the image was created. For example, a value of `300` allows images that were created within the last 300 days.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 2147483647.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreationDateConditionRequest

The maximum age for allowed images.

## Contents

**MaximumDaysSinceCreated**

The maximum number of days that have elapsed since the image was created. For example, a value of `300` allows images that were created within the last 300 days.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 2147483647.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreditSpecification

Describes the credit option for CPU usage of a T instance.

## Contents

**cpuCredits**

The credit option for CPU usage of a T instance.

Valid values: `standard` | `unlimited`

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CreditSpecificationRequest

The credit option for CPU usage of a T instance.

## Contents

### CpuCredits

The credit option for CPU usage of a T instance.

Valid values: `standard` | `unlimited`

Type: String

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# CustomerGateway

Describes a customer gateway.

## Contents

**bgpAsn**

The customer gateway device's Border Gateway Protocol (BGP) Autonomous System Number (ASN).

Valid values: 1 to 2,147,483,647

Type: String

Required: No

**bgpAsnExtended**

The customer gateway device's Border Gateway Protocol (BGP) Autonomous System Number (ASN).

Valid values: 2,147,483,648 to 4,294,967,295

Type: String

Required: No

**certificateArn**

The Amazon Resource Name (ARN) for the customer gateway certificate.

Type: String

Required: No

**customerGatewayId**

The ID of the customer gateway.

Type: String

Required: No

**deviceName**

The name of customer gateway device.

Type: String

Required: No

**ipAddress**

The IP address for the customer gateway device's outside interface. The address must be static. If `OutsideIpAddressType` in your VPN connection options is set to `PrivateIpv4`, you can use an RFC6598 or RFC1918 private IPv4 address. If `OutsideIpAddressType` is set to `PublicIpv4`, you can use a public IPv4 address. If `OutsideIpAddressType` is set to `Ipv6`, you can use a public IPv6 address.

Type: String

Required: No

**state**

The current state of the customer gateway (`pending | available | deleting | deleted`).

Type: String

Required: No

**TagSet.N**

Any tags assigned to the customer gateway.

Type: Array of Tag objects

Required: No

**type**

The type of VPN connection the customer gateway supports (`ipsec.1`).

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DataQuery

A query used for retrieving network health data.

## Contents

**Destination**

The Region or Availability Zone that's the target for the data query. For example, `eu-north-1`.

Type: String

Required: No

**Id**

A user-defined ID associated with a data query that's returned in the `dataResponse` identifying the query. For example, if you set the Id to `MyQuery01`in the query, the `dataResponse` identifies the query as `MyQuery01`.

Type: String

Required: No

**Metric**

The metric used for the network performance request.

Type: String

Valid Values: `aggregate-latency`

Required: No

**Period**

The aggregation period used for the data query.

Type: String

Valid Values: `five-minutes | fifteen-minutes | one-hour | three-hours | one-day | one-week`

Required: No

**Source**

The Region or Availability Zone that's the source for the data query. For example, `us-east-1`.

Type: String

Required: No

**Statistic**

The metric data aggregation period, `p50`, between the specified `startDate` and `endDate`. For example, a metric of `five_minutes` is the median of all the data points gathered within those five minutes. `p50` is the only supported metric.

Type: String

Valid Values: `p50`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DataResponse

The response to a `DataQuery`.

## Contents

**destination**

The Region or Availability Zone that's the destination for the data query. For example, `eu-west-1`.

Type: String

Required: No

**id**

The ID passed in the `DataQuery`.

Type: String

Required: No

**metric**

The metric used for the network performance request.

Type: String

Valid Values: `aggregate-latency`

Required: No

**MetricPointSet.N**

A list of `MetricPoint` objects.

Type: Array of MetricPoint objects

Required: No

**period**

The period used for the network performance request.

Type: String

Valid Values: `five-minutes | fifteen-minutes | one-hour | three-hours | one-day | one-week`

Required: No

**source**

The Region or Availability Zone that's the source for the data query. For example, `us-east-1`.

Type: String

Required: No

**statistic**

The statistic used for the network performance request.

Type: String

Valid Values: `p50`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeclarativePoliciesReport

Describes the metadata of the account status report.

## Contents

**endTime**

The time when the report generation ended.

Type: Timestamp

Required: No

**reportId**

The ID of the report.

Type: String

Required: No

**s3Bucket**

The name of the Amazon S3 bucket where the report is located.

Type: String

Required: No

**s3Prefix**

The prefix for your S3 object.

Type: String

Required: No

**startTime**

The time when the report generation started.

Type: Timestamp

Required: No

**status**

The current status of the report.

Type: String

Valid Values: `running | cancelled | complete | error`

Required: No

**TagSet.N**

Any tags assigned to the report.

Type: Array of Tag objects

Required: No

**targetId**

The root ID, organizational unit ID, or account ID.

Format:

- For root: `r-ab12`
- For OU: `ou-ab12-cdef1234`
- For account: `123456789012`

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DefaultConnectionTrackingConfiguration

Indicates default conntrack information for the instance type. For more information, see Connection tracking timeouts in the Amazon EC2 User Guide.

## Contents

**defaultTcpEstablishedTimeout**

Default timeout (in seconds) for idle TCP connections in an established state.

Type: Integer

Required: No

**defaultUdpStreamTimeout**

Default timeout (in seconds) for idle UDP flows classified as streams which have seen more than one request-response transaction.

Type: Integer

Required: No

**defaultUdpTimeout**

Default timeout (in seconds) for idle UDP flows that have seen traffic only in a single direction or a single request-response transaction.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeleteFleetError

Describes an EC2 Fleet error.

## Contents

**code**

The error code.

Type: String

Valid Values: `fleetIdDoesNotExist | fleetIdMalformed | fleetNotInDeletableState | unexpectedError`

Required: No

**message**

The description for the error code.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeleteFleetErrorItem

Describes an EC2 Fleet that was not successfully deleted.

## Contents

**error**

The error.

Type: DeleteFleetError object

Required: No

**fleetId**

The ID of the EC2 Fleet.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeleteFleetSuccessItem

Describes an EC2 Fleet that was successfully deleted.

## Contents

**currentFleetState**

The current state of the EC2 Fleet.

Type: String

Valid Values: `submitted | active | deleted | failed | deleted_running | deleted_terminating | modifying`

Required: No

**fleetId**

The ID of the EC2 Fleet.

Type: String

Required: No

**previousFleetState**

The previous state of the EC2 Fleet.

Type: String

Valid Values: `submitted | active | deleted | failed | deleted_running | deleted_terminating | modifying`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeleteLaunchTemplateVersionsResponseErrorItem

Describes a launch template version that could not be deleted.

## Contents

**launchTemplateId**

The ID of the launch template.

Type: String

Required: No

**launchTemplateName**

The name of the launch template.

Type: String

Required: No

**responseError**

Information about the error.

Type: ResponseError object

Required: No

**versionNumber**

The version number of the launch template.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeleteLaunchTemplateVersionsResponseSuccessItem

Describes a launch template version that was successfully deleted.

## Contents

**launchTemplateId**

The ID of the launch template.

Type: String

Required: No

**launchTemplateName**

The name of the launch template.

Type: String

Required: No

**versionNumber**

The version number of the launch template.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeleteQueuedReservedInstancesError

Describes the error for a Reserved Instance whose queued purchase could not be deleted.

## Contents

**code**

The error code.

Type: String

Valid Values: `reserved-instances-id-invalid | reserved-instances-not-in-queued-state | unexpected-error`

Required: No

**message**

The error message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeleteSnapshotReturnCode

The snapshot ID and its deletion result code.

## Contents

**returnCode**

The result code from the snapshot deletion attempt. Possible values:

- `success` - The snapshot was successfully deleted.
- `skipped` - The snapshot was not deleted because it's associated with other AMIs.
- `missing-permissions` - The snapshot was not deleted because the role lacks `DeleteSnapshot` permissions. For more information, see How Amazon EBS works with IAM.
- `internal-error` - The snapshot was not deleted due to a server error.
- `client-error` - The snapshot was not deleted due to a client configuration error.

For details about an error, check the `DeleteSnapshot` event in the CloudTrail event history. For more information, see View event history in the *AWS CloudTrail User Guide*.

Type: String

Valid Values: `success | skipped | missing-permissions | internal-error | client-error`

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeprecationTimeCondition

The maximum period since deprecation for allowed images.

## Contents

**maximumDaysSinceDeprecated**

The maximum number of days that have elapsed since the image was deprecated. When set to `0`, no deprecated images are allowed.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 2147483647.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeprecationTimeConditionRequest

The maximum period since deprecation for allowed images.

## Contents

**MaximumDaysSinceDeprecated**

The maximum number of days that have elapsed since the image was deprecated. Set to `0` to exclude all deprecated images.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 2147483647.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeregisterInstanceTagAttributeRequest

Information about the tag keys to deregister for the current Region. You can either specify individual tag keys or deregister all tag keys in the current Region. You must specify either `IncludeAllTagsOfInstance` or `InstanceTagKeys` in the request

## Contents

**IncludeAllTagsOfInstance**

Indicates whether to deregister all tag keys in the current Region. Specify `false` to deregister all tag keys.

Type: Boolean

Required: No

**InstanceTagKey.N**

Information about the tag keys to deregister.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DescribeFastLaunchImagesSuccessItem

Describe details about a Windows image with Windows fast launch enabled that meets the requested criteria. Criteria are defined by the `DescribeFastLaunchImages` action filters.

## Contents

**imageId**

The image ID that identifies the Windows fast launch enabled image.

Type: String

Required: No

**launchTemplate**

The launch template that the Windows fast launch enabled AMI uses when it launches Windows instances from pre-provisioned snapshots.

Type: FastLaunchLaunchTemplateSpecificationResponse object

Required: No

**maxParallelLaunches**

The maximum number of instances that Amazon EC2 can launch at the same time to create pre-provisioned snapshots for Windows fast launch.

Type: Integer

Required: No

**ownerId**

The owner ID for the Windows fast launch enabled AMI.

Type: String

Required: No

**resourceType**

The resource type that Amazon EC2 uses for pre-provisioning the Windows AMI. Supported values include: `snapshot`.

Type: String

Valid Values: `snapshot`

Required: No

**snapshotConfiguration**

A group of parameters that are used for pre-provisioning the associated Windows AMI using snapshots.

Type: FastLaunchSnapshotConfigurationResponse object

Required: No

**state**

The current state of Windows fast launch for the specified Windows AMI.

Type: String

Valid Values: `enabling | enabling-failed | enabled | enabled-failed | disabling | disabling-failed`

Required: No

**stateTransitionReason**

The reason that Windows fast launch for the AMI changed to the current state.

Type: String

Required: No

**stateTransitionTime**

The time that Windows fast launch for the AMI changed to the current state.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DescribeFastSnapshotRestoreSuccessItem

Describes fast snapshot restores for a snapshot.

## Contents

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**disabledTime**

The time at which fast snapshot restores entered the `disabled` state.

Type: Timestamp

Required: No

**disablingTime**

The time at which fast snapshot restores entered the `disabling` state.

Type: Timestamp

Required: No

**enabledTime**

The time at which fast snapshot restores entered the `enabled` state.

Type: Timestamp

Required: No

**enablingTime**

The time at which fast snapshot restores entered the `enabling` state.

Type: Timestamp

Required: No

**optimizingTime**

The time at which fast snapshot restores entered the `optimizing` state.

Type: Timestamp

Required: No

**ownerAlias**

The AWS owner alias that enabled fast snapshot restores on the snapshot. This is intended for future use.

Type: String

Required: No

**ownerId**

The ID of the AWS account that enabled fast snapshot restores on the snapshot.

Type: String

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

**state**

The state of fast snapshot restores.

Type: String

Valid Values: `enabling | optimizing | enabled | disabling | disabled`

Required: No

**stateTransitionReason**

The reason for the state transition. The possible values are as follows:

- `Client.UserInitiated` - The state successfully transitioned to `enabling` or `disabling`.
- `Client.UserInitiated - Lifecycle state transition` - The state successfully transitioned to `optimizing`, `enabled`, or `disabled`.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DescribeFleetError

Describes the instances that could not be launched by the fleet.

## Contents

**errorCode**

The error code that indicates why the instance could not be launched. For more information about error codes, see Error codes.

Type: String

Required: No

**errorMessage**

The error message that describes why the instance could not be launched. For more information about error messages, see Error codes.

Type: String

Required: No

**launchTemplateAndOverrides**

The launch templates and overrides that were used for launching the instances. The values that you specify in the Overrides replace the values in the launch template.

Type: LaunchTemplateAndOverridesResponse object

Required: No

**lifecycle**

Indicates if the instance that could not be launched was a Spot, On-Demand, Capacity Block, or Interruptible Capacity Reservation instance.

Type: String

Valid Values: `spot | on-demand | interruptible-capacity-reservation`

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DescribeFleetsInstances

Describes the instances that were launched by the fleet.

## Contents

**InstanceIds.N**

The IDs of the instances.

Type: Array of strings

Required: No

**instanceType**

The instance type.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge

Required: No

**launchTemplateAndOverrides**

The launch templates and overrides that were used for launching the instances. The values that you specify in the Overrides replace the values in the launch template.

Type: LaunchTemplateAndOverridesResponse object

Required: No

**lifecycle**

Indicates if the instance that was launched is a Spot, On-Demand, Capacity Block, or Interruptible Capacity Reservation instance.

Type: String

Valid Values: `spot | on-demand | interruptible-capacity-reservation`

Required: No

**platform**

The value is `windows` for Windows instances in an EC2 Fleet. Otherwise, the value is blank.

Type: String

Valid Values: `Windows`

Required: No

# DestinationOptionsRequest

Describes the destination options for a flow log.

## Contents

**FileFormat**

The format for the flow log. The default is `plain-text`.

Type: String

Valid Values: `plain-text | parquet`

Required: No

**HiveCompatiblePartitions**

Indicates whether to use Hive-compatible prefixes for flow logs stored in Amazon S3. The default is `false`.

Type: Boolean

Required: No

**PerHourPartition**

Indicates whether to partition the flow log per hour. This reduces the cost and response time for queries. The default is `false`.

Type: Boolean

Required: No

## See Also

# DestinationOptionsResponse

Describes the destination options for a flow log.

## Contents

**fileFormat**

The format for the flow log.

Type: String

Valid Values: `plain-text | parquet`

Required: No

**hiveCompatiblePartitions**

Indicates whether to use Hive-compatible prefixes for flow logs stored in Amazon S3.

Type: Boolean

Required: No

**perHourPartition**

Indicates whether to partition the flow log per hour.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DeviceOptions

Describes the options for an AWS Verified Access device-identity based trust provider.

## Contents

**publicSigningKeyUrl**

The URL AWS Verified Access will use to verify the authenticity of the device tokens.

Type: String

Required: No

**tenantId**

The ID of the tenant application with the device-identity provider.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DhcpConfiguration

Describes a DHCP configuration option.

## Contents

**key**

The name of a DHCP option.

Type: String

Required: No

**ValueSet.N**

The values for the DHCP option.

Type: Array of AttributeValue objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DhcpOptions

The set of DHCP options.

## Contents

**DhcpConfigurationSet.N**

The DHCP options in the set.

Type: Array of DhcpConfiguration objects

Required: No

**dhcpOptionsId**

The ID of the set of DHCP options.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the DHCP options set.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the DHCP options set.

Type: Array of Tag objects

Required: No

## See Also

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DimensionCondition

Specifies a condition for filtering capacity data based on dimension values. Used to create precise filters for metric queries and dimension lookups.

## Contents

**Comparison**

The comparison operator to use for the filter.

Type: String

Valid Values: `equals | in`

Required: No

**Dimension**

The name of the dimension to filter by.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 300.

Valid Values: `resource-region | availability-zone-id | account-id | account-name | instance-family | instance-type | instance-platform | reservation-arn | reservation-id | reservation-type | reservation-create-timestamp | reservation-start-timestamp | reservation-end-timestamp | reservation-end-date-type | tenancy | reservation-state | reservation-instance-match-criteria | reservation-unused-financial-owner`

Required: No

**Value.N**

The list of values to match against the specified dimension. For 'equals' comparison, only the first value is used. For 'in' comparison, any matching value will satisfy the condition.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 10 items.

Length Constraints: Minimum length of 0. Maximum length of 300.

Required: No

# DirectoryServiceAuthentication

Describes an Active Directory.

## Contents

**directoryId**

The ID of the Active Directory used for authentication.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DirectoryServiceAuthenticationRequest

Describes the Active Directory to be used for client authentication.

## Contents

### DirectoryId

The ID of the Active Directory to be used for authentication.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DisableFastSnapshotRestoreErrorItem

Contains information about the errors that occurred when disabling fast snapshot restores.

## Contents

**FastSnapshotRestoreStateErrorSet.N**

The errors.

Type: Array of DisableFastSnapshotRestoreStateErrorItem objects

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DisableFastSnapshotRestoreStateError

Describes an error that occurred when disabling fast snapshot restores.

## Contents

**code**

The error code.

Type: String

Required: No

**message**

The error message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DisableFastSnapshotRestoreStateErrorItem

Contains information about an error that occurred when disabling fast snapshot restores.

## Contents

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**error**

The error.

Type: DisableFastSnapshotRestoreStateError object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DisableFastSnapshotRestoreSuccessItem

Describes fast snapshot restores that were successfully disabled.

## Contents

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**disabledTime**

The time at which fast snapshot restores entered the `disabled` state.

Type: Timestamp

Required: No

**disablingTime**

The time at which fast snapshot restores entered the `disabling` state.

Type: Timestamp

Required: No

**enabledTime**

The time at which fast snapshot restores entered the `enabled` state.

Type: Timestamp

Required: No

**enablingTime**

The time at which fast snapshot restores entered the `enabling` state.

Type: Timestamp

Required: No

**optimizingTime**

The time at which fast snapshot restores entered the `optimizing` state.

Type: Timestamp

Required: No

**ownerAlias**

The AWS owner alias that enabled fast snapshot restores on the snapshot. This is intended for future use.

Type: String

Required: No

**ownerId**

The ID of the AWS account that enabled fast snapshot restores on the snapshot.

Type: String

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

**state**

The state of fast snapshot restores for the snapshot.

Type: String

Valid Values: `enabling | optimizing | enabled | disabling | disabled`

Required: No

**stateTransitionReason**

The reason for the state transition. The possible values are as follows:

- `Client.UserInitiated` - The state successfully transitioned to `enabling` or `disabling`.
- `Client.UserInitiated - Lifecycle state transition` - The state successfully transitioned to `optimizing`, `enabled`, or `disabled`.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DiskImage

Describes a disk image.

## Contents

**Description**

A description of the disk image.

Type: String

Required: No

**Image**

Information about the disk image.

Type: DiskImageDetail object

Required: No

**Volume**

Information about the volume.

Type: VolumeDetail object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DiskImageDescription

Describes a disk image.

## Contents

**checksum**

The checksum computed for the disk image.

Type: String

Required: No

**format**

The disk image format.

Type: String

Valid Values: `VMDK | RAW | VHD`

Required: No

**importManifestUrl**

A presigned URL for the import manifest stored in Amazon S3. For information about creating a presigned URL for an Amazon S3 object, read the "Query String Request Authentication Alternative" section of the Authenticating REST Requests topic in the *Amazon Simple Storage Service Developer Guide*.

For information about the import manifest referenced by this API action, see VM Import Manifest.

Type: String

Required: No

**size**

The size of the disk image, in GiB.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DiskImageDetail

Describes a disk image.

## Contents

**Bytes**

The size of the disk image, in GiB.

Type: Long

Required: Yes

**Format**

The disk image format.

Type: String

Valid Values: `VMDK | RAW | VHD`

Required: Yes

**ImportManifestUrl**

A presigned URL for the import manifest stored in Amazon S3 and presented here as an Amazon S3 presigned URL. For information about creating a presigned URL for an Amazon S3 object, read the "Query String Request Authentication Alternative" section of the Authenticating REST Requests topic in the *Amazon Simple Storage Service Developer Guide*.

For information about the import manifest referenced by this API action, see VM Import Manifest.

Type: String

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DiskImageVolumeDescription

Describes a disk image volume.

## Contents

**id**

The volume identifier.

Type: String

Required: No

**size**

The size of the volume, in GiB.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DiskInfo

Describes a disk.

## Contents

**count**

The number of disks with this configuration.

Type: Integer

Required: No

**sizeInGB**

The size of the disk in GB.

Type: Long

Required: No

**type**

The type of disk.

Type: String

Valid Values: `hdd | ssd`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DnsEntry

Describes a DNS entry.

## Contents

**dnsName**

The DNS name.

Type: String

Required: No

**hostedZoneId**

The ID of the private hosted zone.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DnsOptions

Describes the DNS options for an endpoint.

## Contents

**dnsRecordIpType**

The DNS records created for the endpoint.

Type: String

Valid Values: `ipv4 | dualstack | ipv6 | service-defined`

Required: No

**privateDnsOnlyForInboundResolverEndpoint**

Indicates whether to enable private DNS only for inbound endpoints.

Type: Boolean

Required: No

**privateDnsPreference**

The preference for which private domains have a private hosted zone created for and associated with the specified VPC. Only supported when private DNS is enabled and when the VPC endpoint type is ServiceNetwork or Resource.

- `ALL_DOMAINS` - VPC Lattice provisions private hosted zones for all custom domain names.
- `VERIFIED_DOMAINS_ONLY` - VPC Lattice provisions a private hosted zone only if custom domain name has been verified by the provider.
- `VERIFIED_DOMAINS_AND_SPECIFIED_DOMAINS` - VPC Lattice provisions private hosted zones for all verified custom domain names and other domain names that the resource consumer specifies. The resource consumer specifies the domain names in the PrivateDnsSpecifiedDomains parameter.
- `SPECIFIED_DOMAINS_ONLY` - VPC Lattice provisions a private hosted zone for domain names specified by the resource consumer. The resource consumer specifies the domain names in the PrivateDnsSpecifiedDomains parameter.

Type: String

Required: No

**PrivateDnsSpecifiedDomainSet.N**

Indicates which of the private domains to create private hosted zones for and associate with the specified VPC. Only supported when private DNS is enabled and the private DNS preference is `VERIFIED_DOMAINS_AND_SPECIFIED_DOMAINS` or `SPECIFIED_DOMAINS_ONLY`.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 10 items.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DnsOptionsSpecification

Describes the DNS options for an endpoint.

## Contents

**DnsRecordIpType**

The DNS records created for the endpoint.

Type: String

Valid Values: `ipv4 | dualstack | ipv6 | service-defined`

Required: No

**PrivateDnsOnlyForInboundResolverEndpoint**

Indicates whether to enable private DNS only for inbound endpoints. This option is available only for services that support both gateway and interface endpoints. It routes traffic that originates from the VPC to the gateway endpoint and traffic that originates from on-premises to the interface endpoint.

Type: Boolean

Required: No

**PrivateDnsPreference**

The preference for which private domains have a private hosted zone created for and associated with the specified VPC. Only supported when private DNS is enabled and when the VPC endpoint type is ServiceNetwork or Resource.

- `ALL_DOMAINS` - VPC Lattice provisions private hosted zones for all custom domain names.
- `VERIFIED_DOMAINS_ONLY` - VPC Lattice provisions a private hosted zone only if custom domain name has been verified by the provider.
- `VERIFIED_DOMAINS_AND_SPECIFIED_DOMAINS` - VPC Lattice provisions private hosted zones for all verified custom domain names and other domain names that the resource consumer specifies. The resource consumer specifies the domain names in the PrivateDnsSpecifiedDomains parameter.

- `SPECIFIED_DOMAINS_ONLY` - VPC Lattice provisions a private hosted zone for domain names specified by the resource consumer. The resource consumer specifies the domain names in the PrivateDnsSpecifiedDomains parameter.

Type: String

Required: No

**PrivateDnsSpecifiedDomain.N**

Indicates which of the private domains to create private hosted zones for and associate with the specified VPC. Only supported when private DNS is enabled and the private DNS preference is verified-domains-and-specified-domains or specified-domains-only.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 10 items.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# DnsServersOptionsModifyStructure

Information about the DNS server to be used.

## Contents

**CustomDnsServers.N**

The IPv4 address range, in CIDR notation, of the DNS servers to be used. You can specify up to two DNS servers. Ensure that the DNS servers can be reached by the clients. The specified values overwrite the existing values.

Type: Array of strings

Required: No

**Enabled**

Indicates whether DNS servers should be used. Specify `False` to delete the existing DNS servers.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsBlockDevice

Describes a block device for an EBS volume.

## Contents

**AvailabilityZone** (request), **availabilityZone** (response)

The Availability Zone where the EBS volume will be created (for example, `us-east-1a`).

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both. If neither is specified, Amazon EC2 automatically selects an Availability Zone within the Region.

This parameter is not supported when using CreateFleet, CreateImage, DescribeImages, RequestSpotFleet, RequestSpotInstances, and RunInstances.

Type: String

Required: No

**AvailabilityZoneId** (request), **AvailabilityZoneId** (response)

The ID of the Availability Zone where the EBS volume will be created (for example, `use1-az1`).

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both. If neither is specified, Amazon EC2 automatically selects an Availability Zone within the Region.

This parameter is not supported when using CreateFleet, CreateImage, DescribeImages, RequestSpotFleet, RequestSpotInstances, and RunInstances.

Type: String

Required: No

**DeleteOnTermination** (request), **deleteOnTermination** (response)

Indicates whether the EBS volume is deleted on instance termination. For more information, see Preserving Amazon EBS volumes on instance termination in the *Amazon EC2 User Guide*.

Type: Boolean

Required: No

**EbsCardIndex** (request), **EbsCardIndex** (response)

The index of the EBS card. Some instance types support multiple EBS cards. The default EBS card index is 0.

Type: Integer

Required: No

**Encrypted** (request), **encrypted** (response)

Indicates whether the encryption state of an EBS volume is changed while being restored from a backing snapshot. The effect of setting the encryption state to `true` depends on the volume origin (new or from a snapshot), starting encryption state, ownership, and whether encryption by default is enabled. For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

In no case can you remove encryption from an encrypted volume.

Encrypted volumes can only be attached to instances that support Amazon EBS encryption. For more information, see Supported instance types.

This parameter is not returned by DescribeImageAttribute.

For CreateImage and RegisterImage, whether you can include this parameter, and the allowed values differ depending on the type of block device mapping you are creating.

- If you are creating a block device mapping for a **new (empty) volume**, you can include this parameter, and specify either `true` for an encrypted volume, or `false` for an unencrypted volume. If you omit this parameter, it defaults to `false` (unencrypted).
- If you are creating a block device mapping from an **existing encrypted or unencrypted snapshot**, you must omit this parameter. If you include this parameter, the request will fail, regardless of the value that you specify.
- If you are creating a block device mapping from an **existing unencrypted volume**, you can include this parameter, but you must specify `false`. If you specify `true`, the request will fail. In this case, we recommend that you omit the parameter.
- If you are creating a block device mapping from an **existing encrypted volume**, you can include this parameter, and specify either `true` or `false`. However, if you specify `false`, the parameter is ignored and the block device mapping is always encrypted. In this case, we recommend that you omit the parameter.

Type: Boolean

Required: No

**Iops** (request), **iops** (response)

The number of I/O operations per second (IOPS). For `gp3`, `io1`, and `io2` volumes, this represents the number of IOPS that are provisioned for the volume. For `gp2` volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting.

The following are the supported values for each volume type:

- `gp3`: 3,000 - 80,000 IOPS
- `io1`: 100 - 64,000 IOPS
- `io2`: 100 - 256,000 IOPS

For `io2` volumes, you can achieve up to 256,000 IOPS on instances built on the Nitro System. On other instances, you can achieve performance up to 32,000 IOPS.

This parameter is required for `io1` and `io2` volumes. The default for `gp3` volumes is 3,000 IOPS.

Type: Integer

Required: No

**KmsKeyId** (request), **kmsKeyId** (response)

Identifier (key ID, key alias, key ARN, or alias ARN) of the customer managed KMS key to use for EBS encryption.

This parameter is only supported on `BlockDeviceMapping` objects called by RunInstances, RequestSpotFleet, and RequestSpotInstances.

Type: String

Required: No

**OutpostArn** (request), **outpostArn** (response)

The ARN of the Outpost on which the snapshot is stored.

This parameter is not supported when using CreateImage.

Type: String

Required: No

**SnapshotId** (request), **snapshotId** (response)

The ID of the snapshot.

Type: String

Required: No

**Throughput** (request), **throughput** (response)

The throughput that the volume supports, in MiB/s.

This parameter is valid only for gp3 volumes.

Valid Range: Minimum value of 125. Maximum value of 2,000.

Type: Integer

Required: No

**VolumeInitializationRate** (request), **VolumeInitializationRate** (response)

Specifies the Amazon EBS Provisioned Rate for Volume Initialization (volume initialization rate), in MiB/s, at which to download the snapshot blocks from Amazon S3 to the volume. This is also known as *volume initialization*. Specifying a volume initialization rate ensures that the volume is initialized at a predictable and consistent rate after creation. For more information, see Initialize Amazon EBS volumes in the *Amazon EC2 User Guide*.

This parameter is supported only for volumes created from snapshots. Omit this parameter if:

- You want to create the volume using fast snapshot restore. You must specify a snapshot that is enabled for fast snapshot restore. In this case, the volume is fully initialized at creation.

  > **Note**
  >
  > If you specify a snapshot that is enabled for fast snapshot restore and a volume initialization rate, the volume will be initialized at the specified rate instead of fast snapshot restore.

- You want to create a volume that is initialized at the default rate.

This parameter is not supported when using CreateImage and DescribeImages.

Valid range: 100 - 300 MiB/s

Type: Integer

Required: No

**VolumeSize** (request), **volumeSize** (response)

The size of the volume, in GiBs. You must specify either a snapshot ID or a volume size. If you specify a snapshot, the default is the snapshot size. You can specify a volume size that is equal to or larger than the snapshot size.

The following are the supported sizes for each volume type:

- `gp2`: 1 - 16,384 GiB
- `gp3`: 1 - 65,536 GiB
- `io1`: 4 - 16,384 GiB
- `io2`: 4 - 65,536 GiB
- `st1` and `sc1`: 125 - 16,384 GiB
- `standard`: 1 - 1024 GiB

Type: Integer

Required: No

**VolumeType** (request), **volumeType** (response)

The volume type. For more information, see Amazon EBS volume types in the *Amazon EBS User Guide*.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsBlockDeviceResponse

Describes a block device for an EBS volume.

## Contents

**deleteOnTermination**

Indicates whether the volume is deleted on instance termination.

Type: Boolean

Required: No

**encrypted**

Indicates whether the volume is encrypted.

Type: Boolean

Required: No

**iops**

The number of I/O operations per second (IOPS). For `gp3`, `io1`, and `io2` volumes, this represents the number of IOPS that are provisioned for the volume. For `gp2` volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting.

Type: Integer

Required: No

**kmsKeyId**

Identifier (key ID, key alias, key ARN, or alias ARN) of the customer managed KMS key to use for EBS encryption.

Type: String

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

**throughput**

The throughput that the volume supports, in MiB/s.

Type: Integer

Required: No

**volumeSize**

The size of the volume, in GiBs.

Type: Integer

Required: No

**volumeType**

The volume type. For more information, see Amazon EBS volume types in the *Amazon EBS User Guide*.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsCardInfo

Describes the performance characteristics of an EBS card on the instance type.

## Contents

**baselineBandwidthInMbps**

The baseline bandwidth performance for the EBS card, in Mbps.

Type: Integer

Required: No

**baselineIops**

The baseline IOPS performance for the EBS card.

Type: Integer

Required: No

**baselineThroughputInMBps**

The baseline throughput performance for the EBS card, in MBps.

Type: Double

Required: No

**ebsCardIndex**

The index of the EBS card.

Type: Integer

Required: No

**maximumBandwidthInMbps**

The maximum bandwidth performance for the EBS card, in Mbps.

Type: Integer

Required: No

**maximumIops**

The maximum IOPS performance for the EBS card.

Type: Integer

Required: No

**maximumThroughputInMBps**

The maximum throughput performance for the EBS card, in MBps.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsInfo

Describes the Amazon EBS features supported by the instance type.

## Contents

**attachmentLimitType**

Indicates whether the instance type features a shared or dedicated Amazon EBS volume attachment limit. For more information, see Amazon EBS volume limits for Amazon EC2 instances in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `shared | dedicated`

Required: No

**EbsCardSet.N**

Describes the EBS cards available for the instance type.

Type: Array of EbsCardInfo objects

Required: No

**ebsOptimizedInfo**

Describes the optimized EBS performance for the instance type.

Type: EbsOptimizedInfo object

Required: No

**ebsOptimizedSupport**

Indicates whether the instance type is Amazon EBS-optimized. For more information, see Amazon EBS-optimized instances in *Amazon EC2 User Guide*.

Type: String

Valid Values: `unsupported | supported | default`

Required: No

**encryptionSupport**

Indicates whether Amazon EBS encryption is supported.

Type: String

Valid Values: `unsupported | supported`

Required: No

**maximumEbsAttachments**

Indicates the maximum number of Amazon EBS volumes that can be attached to the instance type. For more information, see Amazon EBS volume limits for Amazon EC2 instances in the *Amazon EC2 User Guide*.

Type: Integer

Required: No

**maximumEbsCards**

Indicates the number of EBS cards supported by the instance type.

Type: Integer

Required: No

**nvmeSupport**

Indicates whether non-volatile memory express (NVMe) is supported.

Type: String

Valid Values: `unsupported | supported | required`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsInstanceBlockDevice

Describes a parameter used to set up an EBS volume in a block device mapping.

## Contents

**associatedResource**

The ARN of the AWS-managed resource to which the volume is attached.

Type: String

Required: No

**attachTime**

The time stamp when the attachment initiated.

Type: Timestamp

Required: No

**deleteOnTermination**

Indicates whether the volume is deleted on instance termination.

Type: Boolean

Required: No

**ebsCardIndex**

The index of the EBS card. Some instance types support multiple EBS cards. The default EBS card index is 0.

Type: Integer

Required: No

**operator**

The service provider that manages the EBS volume.

Type: OperatorResponse object

Required: No

**status**

The attachment state.

Type: String

Valid Values: `attaching | attached | detaching | detached`

Required: No

**volumeId**

The ID of the EBS volume.

Type: String

Required: No

**volumeOwnerId**

The ID of the AWS account that owns the volume.

This parameter is returned only for volumes that are attached to AWS-managed resources.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsInstanceBlockDeviceSpecification

Describes information used to set up an EBS volume specified in a block device mapping.

## Contents

**DeleteOnTermination**

Indicates whether the volume is deleted on instance termination.

Type: Boolean

Required: No

**VolumeId**

The ID of the EBS volume.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsOptimizedInfo

Describes the optimized EBS performance for supported instance types.

## Contents

**baselineBandwidthInMbps**

The baseline bandwidth performance for an EBS-optimized instance type, in Mbps.

Type: Integer

Required: No

**baselineIops**

The baseline input/output storage operations per seconds for an EBS-optimized instance type.

Type: Integer

Required: No

**baselineThroughputInMBps**

The baseline throughput performance for an EBS-optimized instance type, in MB/s.

Type: Double

Required: No

**maximumBandwidthInMbps**

The maximum bandwidth performance for an EBS-optimized instance type, in Mbps.

Type: Integer

Required: No

**maximumIops**

The maximum input/output storage operations per second for an EBS-optimized instance type.

Type: Integer

Required: No

**maximumThroughputInMBps**

The maximum throughput performance for an EBS-optimized instance type, in MB/s.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsStatusDetails

Describes the attached EBS status check for an instance.

## Contents

**impairedSince**

The date and time when the attached EBS status check failed.

Type: Timestamp

Required: No

**name**

The name of the attached EBS status check.

Type: String

Valid Values: `reachability`

Required: No

**status**

The result of the attached EBS status check.

Type: String

Valid Values: `passed | failed | insufficient-data | initializing`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EbsStatusSummary

Provides a summary of the attached EBS volume status for an instance.

## Contents

**Details.N**

Details about the attached EBS status check for an instance.

Type: Array of EbsStatusDetails objects

Required: No

**status**

The current status.

Type: String

Valid Values: `ok | impaired | insufficient-data | not-applicable | initializing`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ec2InstanceConnectEndpoint

Describes an EC2 Instance Connect Endpoint.

## Contents

**availabilityZone**

The Availability Zone of the EC2 Instance Connect Endpoint.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone of the EC2 Instance Connect Endpoint.

Type: String

Required: No

**createdAt**

The date and time that the EC2 Instance Connect Endpoint was created.

Type: Timestamp

Required: No

**dnsName**

The DNS name of the EC2 Instance Connect Endpoint.

Type: String

Required: No

**fipsDnsName**

The Federal Information Processing Standards (FIPS) compliant DNS name of the EC2 Instance Connect Endpoint.

Type: String

Required: No

**instanceConnectEndpointArn**

The Amazon Resource Name (ARN) of the EC2 Instance Connect Endpoint.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**instanceConnectEndpointId**

The ID of the EC2 Instance Connect Endpoint.

Type: String

Required: No

**ipAddressType**

The IP address type of the endpoint.

Type: String

Valid Values: `ipv4 | dualstack | ipv6`

Required: No

**NetworkInterfaceIdSet.N**

The ID of the elastic network interface that Amazon EC2 automatically created when creating the EC2 Instance Connect Endpoint.

Type: Array of strings

Required: No

**ownerId**

The ID of the AWS account that created the EC2 Instance Connect Endpoint.

Type: String

Required: No

**preserveClientIp**

Indicates whether your client's IP address is preserved as the source when you connect to a resource. The following are the possible values.

- `true` - Use the IP address of the client. Your instance must have an IPv4 address.
- `false` - Use the IP address of the network interface.

Default: `false`

Type: Boolean

Required: No

**publicDnsNames**

The public DNS names of the endpoint.

Type: InstanceConnectEndpointPublicDnsNames object

Required: No

**SecurityGroupIdSet.N**

The security groups associated with the endpoint. If you didn't specify a security group, the default security group for your VPC is associated with the endpoint.

Type: Array of strings

Required: No

**state**

The current state of the EC2 Instance Connect Endpoint.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | delete-in-progress | delete-complete | delete-failed | update-in-progress | update-complete | update-failed`

Required: No

**stateMessage**

The message for the current state of the EC2 Instance Connect Endpoint. Can include a failure message.

Type: String

Required: No

**subnetId**

The ID of the subnet in which the EC2 Instance Connect Endpoint was created.

Type: String

Required: No

**TagSet.N**

The tags assigned to the EC2 Instance Connect Endpoint.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC in which the EC2 Instance Connect Endpoint was created.

Type: String

Required: No

# EfaInfo

Describes the Elastic Fabric Adapters for the instance type.

## Contents

**maximumEfaInterfaces**

The maximum number of Elastic Fabric Adapters for the instance type.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EgressOnlyInternetGateway

Describes an egress-only internet gateway.

## Contents

**AttachmentSet.N**

Information about the attachment of the egress-only internet gateway.

Type: Array of InternetGatewayAttachment objects

Required: No

**egressOnlyInternetGatewayId**

The ID of the egress-only internet gateway.

Type: String

Required: No

**TagSet.N**

The tags assigned to the egress-only internet gateway.

Type: Array of Tag objects

Required: No

# ElasticGpuAssociation

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Describes the association between an instance and an Elastic Graphics accelerator.

## Contents

**elasticGpuAssociationId**

The ID of the association.

Type: String

Required: No

**elasticGpuAssociationState**

The state of the association between the instance and the Elastic Graphics accelerator.

Type: String

Required: No

**elasticGpuAssociationTime**

The time the Elastic Graphics accelerator was associated with the instance.

Type: String

Required: No

**elasticGpuId**

The ID of the Elastic Graphics accelerator.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ElasticGpuHealth

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Describes the status of an Elastic Graphics accelerator.

## Contents

**status**

The health status.

Type: String

Valid Values: `OK | IMPAIRED`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ElasticGpus

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Describes an Elastic Graphics accelerator.

## Contents

**availabilityZone**

The Availability Zone in the which the Elastic Graphics accelerator resides.

Type: String

Required: No

**elasticGpuHealth**

The status of the Elastic Graphics accelerator.

Type: ElasticGpuHealth object

Required: No

**elasticGpuId**

The ID of the Elastic Graphics accelerator.

Type: String

Required: No

**elasticGpuState**

The state of the Elastic Graphics accelerator.

Type: String

Valid Values: ATTACHED

Required: No

**elasticGpuType**

The type of Elastic Graphics accelerator.

Type: String

Required: No

**instanceId**

The ID of the instance to which the Elastic Graphics accelerator is attached.

Type: String

Required: No

**TagSet.N**

The tags assigned to the Elastic Graphics accelerator.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

# ElasticGpuSpecification

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

A specification for an Elastic Graphics accelerator.

## Contents

### Type

The type of Elastic Graphics accelerator.

Type: String

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ElasticGpuSpecificationResponse

Deprecated.

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

## Contents

**type**

Deprecated.

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ElasticInferenceAccelerator

> **Note**
>
> Amazon Elastic Inference is no longer available.

Describes an elastic inference accelerator.

## Contents

**Type**

The type of elastic inference accelerator. The possible values are `eia1.medium`, `eia1.large`, `eia1.xlarge`, `eia2.medium`, `eia2.large`, and `eia2.xlarge`.

Type: String

Required: Yes

**Count**

The number of elastic inference accelerators to attach to the instance.

Default: 1

Type: Integer

Valid Range: Minimum value of 1.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ElasticInferenceAcceleratorAssociation

> **Note**
>
> Amazon Elastic Inference is no longer available.

Describes the association between an instance and an elastic inference accelerator.

## Contents

**elasticInferenceAcceleratorArn**

The Amazon Resource Name (ARN) of the elastic inference accelerator.

Type: String

Required: No

**elasticInferenceAcceleratorAssociationId**

The ID of the association.

Type: String

Required: No

**elasticInferenceAcceleratorAssociationState**

The state of the elastic inference accelerator.

Type: String

Required: No

**elasticInferenceAcceleratorAssociationTime**

The time at which the elastic inference accelerator is associated with an instance.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnableFastSnapshotRestoreErrorItem

Contains information about the errors that occurred when enabling fast snapshot restores.

## Contents

**FastSnapshotRestoreStateErrorSet.N**

The errors.

Type: Array of EnableFastSnapshotRestoreStateErrorItem objects

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnableFastSnapshotRestoreStateError

Describes an error that occurred when enabling fast snapshot restores.

## Contents

**code**

The error code.

Type: String

Required: No

**message**

The error message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnableFastSnapshotRestoreStateErrorItem

Contains information about an error that occurred when enabling fast snapshot restores.

## Contents

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**error**

The error.

Type: EnableFastSnapshotRestoreStateError object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnableFastSnapshotRestoreSuccessItem

Describes fast snapshot restores that were successfully enabled.

## Contents

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**disabledTime**

The time at which fast snapshot restores entered the `disabled` state.

Type: Timestamp

Required: No

**disablingTime**

The time at which fast snapshot restores entered the `disabling` state.

Type: Timestamp

Required: No

**enabledTime**

The time at which fast snapshot restores entered the `enabled` state.

Type: Timestamp

Required: No

**enablingTime**

The time at which fast snapshot restores entered the `enabling` state.

Type: Timestamp

Required: No

**optimizingTime**

The time at which fast snapshot restores entered the `optimizing` state.

Type: Timestamp

Required: No

**ownerAlias**

The AWS owner alias that enabled fast snapshot restores on the snapshot. This is intended for future use.

Type: String

Required: No

**ownerId**

The ID of the AWS account that enabled fast snapshot restores on the snapshot.

Type: String

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

**state**

The state of fast snapshot restores.

Type: String

Valid Values: `enabling | optimizing | enabled | disabling | disabled`

Required: No

**stateTransitionReason**

The reason for the state transition. The possible values are as follows:

- `Client.UserInitiated` - The state successfully transitioned to `enabling` or `disabling`.
- `Client.UserInitiated - Lifecycle state transition` - The state successfully transitioned to `optimizing`, `enabled`, or `disabled`.

Type: String

Required: No

- AWS SDK for Ruby V3

# EnaSrdSpecification

ENA Express uses AWS Scalable Reliable Datagram (SRD) technology to increase the maximum bandwidth used per stream and minimize tail latency of network traffic between EC2 instances. With ENA Express, you can communicate between two EC2 instances in the same subnet within the same account, or in different accounts. Both sending and receiving instances must have ENA Express enabled.

To improve the reliability of network packet delivery, ENA Express reorders network packets on the receiving end by default. However, some UDP-based applications are designed to handle network packets that are out of order to reduce the overhead for packet delivery at the network layer. When ENA Express is enabled, you can specify whether UDP network traffic uses it.

## Contents

**EnaSrdEnabled**

Indicates whether ENA Express is enabled for the network interface.

Type: Boolean

Required: No

**EnaSrdUdpSpecification**

Configures ENA Express for UDP network traffic.

Type: EnaSrdUdpSpecification object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnaSrdSpecificationRequest

Launch instances with ENA Express settings configured from your launch template.

## Contents

**EnaSrdEnabled** (request), **EnaSrdEnabled** (response)

Specifies whether ENA Express is enabled for the network interface when you launch an instance.

Type: Boolean

Required: No

**EnaSrdUdpSpecification** (request), **EnaSrdUdpSpecification** (response)

Contains ENA Express settings for UDP network traffic for the network interface attached to the instance.

Type: EnaSrdUdpSpecificationRequest object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnaSrdUdpSpecification

ENA Express is compatible with both TCP and UDP transport protocols. When it's enabled, TCP traffic automatically uses it. However, some UDP-based applications are designed to handle network packets that are out of order, without a need for retransmission, such as live video broadcasting or other near-real-time applications. For UDP traffic, you can specify whether to use ENA Express, based on your application environment needs.

## Contents

**EnaSrdUdpEnabled**

Indicates whether UDP traffic to and from the instance uses ENA Express. To specify this setting, you must first enable ENA Express.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnaSrdUdpSpecificationRequest

Configures ENA Express for UDP network traffic from your launch template.

## Contents

**EnaSrdUdpEnabled** (request), **EnaSrdUdpEnabled** (response)

Indicates whether UDP traffic uses ENA Express for your instance. To ensure that UDP traffic can use ENA Express when you launch an instance, you must also set **EnaSrdEnabled** in the **EnaSrdSpecificationRequest** to `true`.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnclaveOptions

Indicates whether the instance is enabled for AWS Nitro Enclaves.

## Contents

**enabled**

If this parameter is set to `true`, the instance is enabled for AWS Nitro Enclaves; otherwise, it is not enabled for AWS Nitro Enclaves.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EnclaveOptionsRequest

Indicates whether the instance is enabled for AWS Nitro Enclaves. For more information, see What is AWS Nitro Enclaves? in the *AWS Nitro Enclaves User Guide*.

## Contents

### Enabled

To enable the instance for AWS Nitro Enclaves, set this parameter to `true`.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EncryptionSupport

Describes the encryption support status for a transit gateway.

## Contents

**encryptionState**

The current encryption state of the resource.

Type: String

Valid Values: `enabling | enabled | disabling | disabled`

Required: No

**stateMessage**

A message describing the encryption state.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# EventInformation

Describes an EC2 Fleet or Spot Fleet event.

## Contents

**eventDescription**

The description of the event.

Type: String

Required: No

**eventSubType**

The event.

`error` events:

- `iamFleetRoleInvalid` - The EC2 Fleet or Spot Fleet does not have the required permissions either to launch or terminate an instance.
- `allLaunchSpecsTemporarilyBlacklisted` - None of the configurations are valid, and several attempts to launch instances have failed. For more information, see the description of the event.
- `spotInstanceCountLimitExceeded` - You've reached the limit on the number of Spot Instances that you can launch.
- `spotFleetRequestConfigurationInvalid` - The configuration is not valid. For more information, see the description of the event.

`fleetRequestChange` events:

- `active` - The EC2 Fleet or Spot Fleet request has been validated and Amazon EC2 is attempting to maintain the target number of running instances.
- `deleted` (EC2 Fleet) / `cancelled` (Spot Fleet) - The EC2 Fleet is deleted or the Spot Fleet request is canceled and has no running instances. The EC2 Fleet or Spot Fleet will be deleted two days after its instances are terminated.
- `deleted_running` (EC2 Fleet) / `cancelled_running` (Spot Fleet) - The EC2 Fleet is deleted or the Spot Fleet request is canceled and does not launch additional instances. Its existing instances continue to run until they are interrupted or terminated. The request remains in this state until all instances are interrupted or terminated.

- deleted_terminating (EC2 Fleet) / cancelled_terminating (Spot Fleet) - The EC2 Fleet is deleted or the Spot Fleet request is canceled and its instances are terminating. The request remains in this state until all instances are terminated.
- expired - The EC2 Fleet or Spot Fleet request has expired. If the request was created with TerminateInstancesWithExpiration set, a subsequent terminated event indicates that the instances are terminated.
- modify_in_progress - The EC2 Fleet or Spot Fleet request is being modified. The request remains in this state until the modification is fully processed.
- modify_succeeded - The EC2 Fleet or Spot Fleet request was modified.
- submitted - The EC2 Fleet or Spot Fleet request is being evaluated and Amazon EC2 is preparing to launch the target number of instances.
- progress - The EC2 Fleet or Spot Fleet request is in the process of being fulfilled.

instanceChange events:

- launched - A new instance was launched.
- terminated - An instance was terminated by the user.
- termination_notified - An instance termination notification was sent when a Spot Instance was terminated by Amazon EC2 during scale-down, when the target capacity of the fleet was modified down, for example, from a target capacity of 4 to a target capacity of 3.

Information events:

- fleetProgressHalted - The price in every launch specification is not valid because it is below the Spot price (all the launch specifications have produced launchSpecUnusable events). A launch specification might become valid if the Spot price changes.
- launchSpecTemporarilyBlacklisted - The configuration is not valid and several attempts to launch instances have failed. For more information, see the description of the event.
- launchSpecUnusable - The price specified in a launch specification is not valid because it is below the Spot price for the requested Spot pools.

  Note: Even if a fleet with the maintain request type is in the process of being canceled, it may still publish a launchSpecUnusable event. This does not mean that the canceled fleet is attempting to launch a new instance.
- registerWithLoadBalancersFailed - An attempt to register instances with load balancers failed. For more information, see the description of the event.

Type: String

Required: No

**instanceId**

The ID of the instance. This information is available only for `instanceChange` events.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Explanation

Describes an explanation code for an unreachable path. For more information, see Reachability Analyzer explanation codes.

## Contents

**acl**

The network ACL.

Type: AnalysisComponent object

Required: No

**aclRule**

The network ACL rule.

Type: AnalysisAclRule object

Required: No

**address**

The IPv4 address, in CIDR notation.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**AddressSet.N**

The IPv4 addresses, in CIDR notation.

Type: Array of strings

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**attachedTo**

The resource to which the component is attached.

Type: AnalysisComponent object

Required: No

**AvailabilityZoneIdSet.N**

The IDs of the Availability Zones.

Type: Array of strings

Required: No

**AvailabilityZoneSet.N**

The Availability Zones.

Type: Array of strings

Required: No

**CidrSet.N**

The CIDR ranges.

Type: Array of strings

Required: No

**classicLoadBalancerListener**

The listener for a Classic Load Balancer.

Type: AnalysisLoadBalancerListener object

Required: No

**component**

The component.

Type: AnalysisComponent object

Required: No

**componentAccount**

The AWS account for the component.

Type: String

Pattern: `\d{12}`

Required: No

**componentRegion**

The Region for the component.

Type: String

Pattern: `[a-z]{2}-[a-z]+-[1-9]+`

Required: No

**customerGateway**

The customer gateway.

Type: AnalysisComponent object

Required: No

**destination**

The destination.

Type: AnalysisComponent object

Required: No

**destinationVpc**

The destination VPC.

Type: AnalysisComponent object

Required: No

**direction**

The direction. The following are the possible values:

- egress
- ingress

Type: String

Required: No

**elasticLoadBalancerListener**

The load balancer listener.

Type: AnalysisComponent object

Required: No

**explanationCode**

The explanation code.

Type: String

Required: No

**firewallStatefulRule**

The Network Firewall stateful rule.

Type: FirewallStatefulRule object

Required: No

**firewallStatelessRule**

The Network Firewall stateless rule.

Type: FirewallStatelessRule object

Required: No

**ingressRouteTable**

The route table.

Type: AnalysisComponent object

Required: No

**internetGateway**

The internet gateway.

Type: AnalysisComponent object

Required: No

**loadBalancerArn**

The Amazon Resource Name (ARN) of the load balancer.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**loadBalancerListenerPort**

The listener port of the load balancer.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

**loadBalancerTarget**

The target.

Type: AnalysisLoadBalancerTarget object

Required: No

**loadBalancerTargetGroup**

The target group.

Type: AnalysisComponent object

Required: No

**LoadBalancerTargetGroupSet.N**

The target groups.

Type: Array of AnalysisComponent objects

Required: No

**loadBalancerTargetPort**

The target port.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

**missingComponent**

The missing component.

Type: String

Required: No

**natGateway**

The NAT gateway.

Type: AnalysisComponent object

Required: No

**networkInterface**

The network interface.

Type: AnalysisComponent object

Required: No

**packetField**

The packet field.

Type: String

Required: No

**port**

The port.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

**PortRangeSet.N**

The port ranges.

Type: Array of PortRange objects

Required: No

**prefixList**

The prefix list.

Type: AnalysisComponent object

Required: No

**ProtocolSet.N**

The protocols.

Type: Array of strings

Required: No

**routeTable**

The route table.

Type: AnalysisComponent object

Required: No

**routeTableRoute**

The route table route.

Type: AnalysisRouteTableRoute object

Required: No

**securityGroup**

The security group.

Type: AnalysisComponent object

Required: No

**securityGroupRule**

The security group rule.

Type: AnalysisSecurityGroupRule object

Required: No

**SecurityGroupSet.N**

The security groups.

Type: Array of AnalysisComponent objects

Required: No

**sourceVpc**

The source VPC.

Type: AnalysisComponent object

Required: No

**state**

The state.

Type: String

Required: No

**subnet**

The subnet.

Type: AnalysisComponent object

Required: No

**subnetRouteTable**

The route table for the subnet.

Type: AnalysisComponent object

Required: No

**transitGateway**

The transit gateway.

Type: AnalysisComponent object

Required: No

**transitGatewayAttachment**

The transit gateway attachment.

Type: AnalysisComponent object

Required: No

**transitGatewayRouteTable**

The transit gateway route table.

Type: AnalysisComponent object

Required: No

**transitGatewayRouteTableRoute**

The transit gateway route table route.

Type: TransitGatewayRouteTableRoute object

Required: No

**vpc**

The component VPC.

Type: AnalysisComponent object

Required: No

**vpcEndpoint**

The VPC endpoint.

Type: AnalysisComponent object

Required: No

**vpcPeeringConnection**

The VPC peering connection.

Type: AnalysisComponent object

Required: No

**vpnConnection**

The VPN connection.

Type: AnalysisComponent object

Required: No

**vpnGateway**

The VPN gateway.

Type: AnalysisComponent object

Required: No

# ExportImageTask

Describes an export image task.

## Contents

**description**

A description of the image being exported.

Type: String

Required: No

**exportImageTaskId**

The ID of the export image task.

Type: String

Required: No

**imageId**

The ID of the image.

Type: String

Required: No

**progress**

The percent complete of the export image task.

Type: String

Required: No

**s3ExportLocation**

Information about the destination Amazon S3 bucket.

Type: ExportTaskS3Location object

Required: No

**status**

The status of the export image task. The possible values are `active`, `completed`, `deleting`, and `deleted`.

Type: String

Required: No

**statusMessage**

The status message for the export image task.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the export image task.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ExportTask

Describes an export instance task.

## Contents

**description**

A description of the resource being exported.

Type: String

Required: No

**exportTaskId**

The ID of the export task.

Type: String

Required: No

**exportToS3**

Information about the export task.

Type: ExportToS3Task object

Required: No

**instanceExport**

Information about the instance to export.

Type: InstanceExportDetails object

Required: No

**state**

The state of the export task.

Type: String

Valid Values: `active | cancelling | cancelled | completed`

Required: No

**statusMessage**

The status message related to the export task.

Type: String

Required: No

**TagSet.N**

The tags for the export task.

Type: Array of Tag objects

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ExportTaskS3Location

Describes the destination for an export image task.

## Contents

**s3Bucket**

The destination Amazon S3 bucket.

Type: String

Required: No

**s3Prefix**

The prefix (logical hierarchy) in the bucket.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ExportTaskS3LocationRequest

Describes the destination for an export image task.

## Contents

**S3Bucket**

The destination Amazon S3 bucket.

Type: String

Required: Yes

**S3Prefix**

The prefix (logical hierarchy) in the bucket.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for Ruby V3

# ExportToS3Task

Describes the format and location for the export task.

## Contents

**containerFormat**

The container format used to combine disk images with metadata (such as OVF). If absent, only the disk image is exported.

Type: String

Valid Values: `ova`

Required: No

**diskImageFormat**

The format for the exported image.

Type: String

Valid Values: `VMDK | RAW | VHD`

Required: No

**s3Bucket**

The Amazon S3 bucket for the destination image. The destination bucket must exist and have an access control list (ACL) attached that specifies the Region-specific canonical account ID for the `Grantee`. For more information about the ACL to your S3 bucket, see Prerequisites in the VM Import/Export User Guide.

Type: String

Required: No

**s3Key**

The encryption key for your S3 bucket.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ExportToS3TaskSpecification

Describes an export instance task.

## Contents

**ContainerFormat**

The container format used to combine disk images with metadata (such as OVF). If absent, only the disk image is exported.

Type: String

Valid Values: `ova`

Required: No

**DiskImageFormat**

The format for the exported image.

Type: String

Valid Values: `VMDK | RAW | VHD`

Required: No

**S3Bucket**

The Amazon S3 bucket for the destination image. The destination bucket must exist and have an access control list (ACL) attached that specifies the Region-specific canonical account ID for the `Grantee`. For more information about the ACL to your S3 bucket, see Prerequisites in the VM Import/Export User Guide.

Type: String

Required: No

**S3Prefix**

The image is written to a single object in the Amazon S3 bucket at the S3 key s3prefix + exportTaskId + '.' + diskImageFormat.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ExternalAuthorityConfiguration

The configuration that links an Amazon VPC IPAM scope to an external authority system. It specifies the type of external system and the external resource identifier that identifies your account or instance in that system.

For more information, see Integrate VPC IPAM with Infoblox infrastructure in the *Amazon VPC IPAM User Guide*.

## Contents

**ExternalResourceIdentifier**

The identifier for the external resource managing this scope. For Infoblox integrations, this is the Infoblox resource identifier in the format `<version>.identity.account.<entity_realm>.<entity_id>`.

Type: String

Required: No

**Type**

The type of external authority.

Type: String

Valid Values: `infoblox`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FailedCapacityReservationFleetCancellationResult

Describes a Capacity Reservation Fleet that could not be cancelled.

## Contents

**cancelCapacityReservationFleetError**

Information about the Capacity Reservation Fleet cancellation error.

Type: CancelCapacityReservationFleetError object

Required: No

**capacityReservationFleetId**

The ID of the Capacity Reservation Fleet that could not be cancelled.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FailedQueuedPurchaseDeletion

Describes a Reserved Instance whose queued purchase was not deleted.

## Contents

**error**

The error.

Type: DeleteQueuedReservedInstancesError object

Required: No

**reservedInstancesId**

The ID of the Reserved Instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FastLaunchLaunchTemplateSpecificationRequest

Request to create a launch template for a Windows fast launch enabled AMI.

> **Note**
>
> Note - You can specify either the `LaunchTemplateName` or the `LaunchTemplateId`, but not both.

## Contents

**Version**

Specify the version of the launch template that the AMI should use for Windows fast launch.

Type: String

Required: Yes

**LaunchTemplateId**

Specify the ID of the launch template that the AMI should use for Windows fast launch.

Type: String

Required: No

**LaunchTemplateName**

Specify the name of the launch template that the AMI should use for Windows fast launch.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FastLaunchLaunchTemplateSpecificationResponse

Identifies the launch template that the AMI uses for Windows fast launch.

## Contents

**launchTemplateId**

The ID of the launch template that the AMI uses for Windows fast launch.

Type: String

Required: No

**launchTemplateName**

The name of the launch template that the AMI uses for Windows fast launch.

Type: String

Required: No

**version**

The version of the launch template that the AMI uses for Windows fast launch.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FastLaunchSnapshotConfigurationRequest

Configuration settings for creating and managing pre-provisioned snapshots for a Windows fast launch enabled AMI.

## Contents

**TargetResourceCount**

The number of pre-provisioned snapshots to keep on hand for a Windows fast launch enabled AMI.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FastLaunchSnapshotConfigurationResponse

Configuration settings for creating and managing pre-provisioned snapshots for a Windows fast launch enabled Windows AMI.

## Contents

**targetResourceCount**

The number of pre-provisioned snapshots requested to keep on hand for a Windows fast launch enabled AMI.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FederatedAuthentication

Describes the IAM SAML identity providers used for federated authentication.

## Contents

**samlProviderArn**

The Amazon Resource Name (ARN) of the IAM SAML identity provider.

Type: String

Required: No

**selfServiceSamlProviderArn**

The Amazon Resource Name (ARN) of the IAM SAML identity provider for the self-service portal.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FederatedAuthenticationRequest

The IAM SAML identity provider used for federated authentication.

## Contents

**SAMLProviderArn**

The Amazon Resource Name (ARN) of the IAM SAML identity provider.

Type: String

Required: No

**SelfServiceSAMLProviderArn**

The Amazon Resource Name (ARN) of the IAM SAML identity provider for the self-service portal.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Filter

A filter name and value pair that is used to return a more specific list of results from a describe operation. Filters can be used to match a set of resources by specific criteria, such as tags, attributes, or IDs.

If you specify multiple filters, the filters are joined with an `AND`, and the request returns only results that match all of the specified filters.

The filters supported by a describe operation are documented with the describe operation. For example:

- DescribeAvailabilityZones
- DescribeImages
- DescribeInstances
- DescribeKeyPairs
- DescribeSecurityGroups
- DescribeSnapshots
- DescribeSubnets
- DescribeTags
- DescribeVolumes
- DescribeVpcs

For more information, see List and filter using the CLI and API in the *Amazon EC2 User Guide*.

## Contents

**Name**

The name of the filter. Filter names are case-sensitive.

Type: String

Required: No

**Value.N**

The filter values. Filter values are case-sensitive. If you specify multiple values for a filter, the values are joined with an OR, and the request returns all results that match any of the specified values.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FilterPortRange

Describes a port range.

## Contents

**fromPort**

The first port in the range.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

**toPort**

The last port in the range.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FirewallStatefulRule

Describes a stateful rule.

## Contents

**DestinationPortSet.N**

The destination ports.

Type: Array of PortRange objects

Required: No

**DestinationSet.N**

The destination IP addresses, in CIDR notation.

Type: Array of strings

Required: No

**direction**

The direction. The possible values are `FORWARD` and `ANY`.

Type: String

Required: No

**protocol**

The protocol.

Type: String

Required: No

**ruleAction**

The rule action. The possible values are `pass`, `drop`, and `alert`.

Type: String

Required: No

**ruleGroupArn**

The ARN of the stateful rule group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**SourcePortSet.N**

The source ports.

Type: Array of PortRange objects

Required: No

**SourceSet.N**

The source IP addresses, in CIDR notation.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FirewallStatelessRule

Describes a stateless rule.

## Contents

**DestinationPortSet.N**

The destination ports.

Type: Array of PortRange objects

Required: No

**DestinationSet.N**

The destination IP addresses, in CIDR notation.

Type: Array of strings

Required: No

**priority**

The rule priority.

Type: Integer

Valid Range: Minimum value of -1. Maximum value of 65535.

Required: No

**ProtocolSet.N**

The protocols.

Type: Array of integers

Valid Range: Minimum value of 0. Maximum value of 255.

Required: No

**ruleAction**

The rule action. The possible values are `pass`, `drop`, and `forward_to_site`.

Type: String

Required: No

**ruleGroupArn**

The ARN of the stateless rule group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**SourcePortSet.N**

The source ports.

Type: Array of PortRange objects

Required: No

**SourceSet.N**

The source IP addresses, in CIDR notation.

Type: Array of strings

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FleetBlockDeviceMappingRequest

Describes a block device mapping, which defines the EBS volumes and instance store volumes to attach to an instance at launch.

To override a block device mapping specified in the launch template:

- Specify the exact same `DeviceName` here as specified in the launch template.
- Only specify the parameters you want to change.
- Any parameters you don't specify here will keep their original launch template values.

To add a new block device mapping:

- Specify a `DeviceName` that doesn't exist in the launch template.
- Specify all desired parameters here.

## Contents

**DeviceName**

The device name (for example, `/dev/sdh` or `xvdh`).

Type: String

Required: No

**Ebs**

Parameters used to automatically set up EBS volumes when the instance is launched.

Type: FleetEbsBlockDeviceRequest object

Required: No

**NoDevice**

To omit the device from the block device mapping, specify an empty string. When this property is specified, the device is removed from the block device mapping regardless of the assigned value.

Type: String

Required: No

**VirtualName**

The virtual device name (`ephemeralN`). Instance store volumes are numbered starting from 0. An instance type with 2 available instance store volumes can specify mappings for `ephemeral0` and `ephemeral1`. The number of available instance store volumes depends on the instance type. After you connect to the instance, you must mount the volume.

NVMe instance store volumes are automatically enumerated and assigned a device name. Including them in your block device mapping has no effect.

Constraints: For M3 instances, you must specify instance store volumes in the block device mapping for the instance. When you launch an M3 instance, we ignore any instance store volumes specified in the block device mapping for the AMI.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FleetCapacityReservation

Information about a Capacity Reservation in a Capacity Reservation Fleet.

## Contents

**availabilityZone**

The Availability Zone in which the Capacity Reservation reserves capacity.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone in which the Capacity Reservation reserves capacity.

Type: String

Required: No

**capacityReservationId**

The ID of the Capacity Reservation.

Type: String

Required: No

**createDate**

The date and time at which the Capacity Reservation was created.

Type: Timestamp

Required: No

**ebsOptimized**

Indicates whether the Capacity Reservation reserves capacity for EBS-optimized instance types.

Type: Boolean

Required: No

**fulfilledCapacity**

The number of capacity units fulfilled by the Capacity Reservation. For more information, see Total target capacity in the *Amazon EC2 User Guide*.

Type: Double

Required: No

**instancePlatform**

The type of operating system for which the Capacity Reservation reserves capacity.

Type: String

Valid Values: `Linux/UNIX | Red Hat Enterprise Linux | SUSE Linux | Windows | Windows with SQL Server | Windows with SQL Server Enterprise | Windows with SQL Server Standard | Windows with SQL Server Web | Linux with SQL Server Standard | Linux with SQL Server Web | Linux with SQL Server Enterprise | RHEL with SQL Server Standard | RHEL with SQL Server Enterprise | RHEL with SQL Server Web | RHEL with HA | RHEL with HA and SQL Server Standard | RHEL with HA and SQL Server Enterprise | Ubuntu Pro`

Required: No

**instanceType**

The instance type for which the Capacity Reservation reserves capacity.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge |`

c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge | g4dn.xlarge | g4dn.2xlarge | g4dn.4xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.xlarge | g5.2xlarge | g5.4xlarge | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge | g5.48xlarge | g5g.xlarge | g5g.2xlarge | g5g.4xlarge | g5g.8xlarge | g5g.16xlarge | g5g.metal | hi1.4xlarge | hpc6a.48xlarge | hs1.8xlarge | h1.2xlarge | h1.4xlarge | h1.8xlarge | h1.16xlarge | i2.xlarge | i2.2xlarge | i2.4xlarge | i2.8xlarge | i3.large | i3.xlarge | i3.2xlarge | i3.4xlarge | i3.8xlarge | i3.16xlarge | i3.metal | i3en.large | i3en.xlarge | i3en.2xlarge | i3en.3xlarge | i3en.6xlarge | i3en.12xlarge | i3en.24xlarge | i3en.metal | im4gn.large | im4gn.xlarge | im4gn.2xlarge | im4gn.4xlarge | im4gn.8xlarge | im4gn.16xlarge | inf1.xlarge | inf1.2xlarge | inf1.6xlarge | inf1.24xlarge | is4gen.medium | is4gen.large | is4gen.xlarge | is4gen.2xlarge | is4gen.4xlarge | is4gen.8xlarge | m1.small | m1.medium | m1.large | m1.xlarge | m2.xlarge | m2.2xlarge | m2.4xlarge | m3.medium | m3.large | m3.xlarge | m3.2xlarge | m4.large | m4.xlarge | m4.2xlarge | m4.4xlarge | m4.10xlarge | m4.16xlarge | m5.large | m5.xlarge | m5.2xlarge | m5.4xlarge | m5.8xlarge | m5.12xlarge | m5.16xlarge | m5.24xlarge | m5.metal | m5a.large | m5a.xlarge | m5a.2xlarge | m5a.4xlarge | m5a.8xlarge | m5a.12xlarge | m5a.16xlarge | m5a.24xlarge | m5ad.large | m5ad.xlarge | m5ad.2xlarge | m5ad.4xlarge | m5ad.8xlarge

Required: No

**priority**

The priority of the instance type in the Capacity Reservation Fleet. For more information, see Instance type priority in the *Amazon EC2 User Guide*.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**totalInstanceCount**

The total number of instances for which the Capacity Reservation reserves capacity.

Type: Integer

Required: No

**weight**

The weight of the instance type in the Capacity Reservation Fleet. For more information, see Instance type weight in the *Amazon EC2 User Guide*.

Type: Double

Valid Range: Minimum value of 0.001. Maximum value of 99.999.

Required: No

# FleetData

Describes an EC2 Fleet.

## Contents

**activityStatus**

The progress of the EC2 Fleet.

For fleets of type `instant`, the status is `fulfilled` after all requests are placed, regardless of whether target capacity is met (this is the only possible status for `instant` fleets).

For fleets of type `request` or `maintain`, the status is `pending_fulfillment` after all requests are placed, `fulfilled` when the fleet size meets or exceeds target capacity, `pending_termination` while instances are terminating when fleet size is decreased, and `error` if there's an error.

Type: String

Valid Values: `error | pending_fulfillment | pending_termination | fulfilled`

Required: No

**clientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring idempotency.

Constraints: Maximum 64 ASCII characters

Type: String

Required: No

**context**

Reserved.

Type: String

Required: No

**createTime**

The creation date and time of the EC2 Fleet.

Type: Timestamp

Required: No

**ErrorSet.N**

Information about the instances that could not be launched by the fleet. Valid only when **Type** is set to `instant`.

Type: Array of DescribeFleetError objects

Required: No

**excessCapacityTerminationPolicy**

Indicates whether running instances should be terminated if the target capacity of the EC2 Fleet is decreased below the current size of the EC2 Fleet.

Supported only for fleets of type `maintain`.

Type: String

Valid Values: `no-termination | termination`

Required: No

**fleetId**

The ID of the EC2 Fleet.

Type: String

Required: No

**FleetInstanceSet.N**

Information about the instances that were launched by the fleet. Valid only when **Type** is set to `instant`.

Type: Array of DescribeFleetsInstances objects

Required: No

**fleetState**

The state of the EC2 Fleet.

Type: String

Valid Values: `submitted | active | deleted | failed | deleted_running | deleted_terminating | modifying`

Required: No

**fulfilledCapacity**

The number of units fulfilled by this request compared to the set target capacity.

Type: Double

Required: No

**fulfilledOnDemandCapacity**

The number of units fulfilled by this request compared to the set target On-Demand capacity.

Type: Double

Required: No

**LaunchTemplateConfigs.N**

The launch template and overrides.

Type: Array of FleetLaunchTemplateConfig objects

Required: No

**onDemandOptions**

The allocation strategy of On-Demand Instances in an EC2 Fleet.

Type: OnDemandOptions object

Required: No

**replaceUnhealthyInstances**

Indicates whether EC2 Fleet should replace unhealthy Spot Instances. Supported only for fleets of type `maintain`. For more information, see EC2 Fleet health checks in the *Amazon EC2 User Guide*.

Type: Boolean

Required: No

**reservedCapacityOptions**

Defines EC2 Fleet preferences for utilizing reserved capacity when DefaultTargetCapacityType is set to `reserved-capacity`.

Type: ReservedCapacityOptions object

Required: No

**spotOptions**

The configuration of Spot Instances in an EC2 Fleet.

Type: SpotOptions object

Required: No

**TagSet.N**

The tags for an EC2 Fleet resource.

Type: Array of Tag objects

Required: No

**targetCapacitySpecification**

The number of units to request. You can choose to set the target capacity in terms of instances or a performance characteristic that is important to your application workload, such as vCPUs, memory, or I/O. If the request type is `maintain`, you can specify a target capacity of 0 and add capacity later.

Type: TargetCapacitySpecification object

Required: No

**terminateInstancesWithExpiration**

Indicates whether running instances should be terminated when the EC2 Fleet expires.

Type: Boolean

Required: No

**type**

The type of request. Indicates whether the EC2 Fleet only `requests` the target capacity, or also attempts to `maintain` it. If you request a certain target capacity, EC2 Fleet only places the required requests; it does not attempt to replenish instances if capacity is diminished, and it does not submit requests in alternative capacity pools if capacity is unavailable. To maintain a certain target capacity, EC2 Fleet places the required requests to meet this target capacity. It also automatically replenishes any interrupted Spot Instances. Default: `maintain`.

Type: String

Valid Values: `request | maintain | instant`

Required: No

**validFrom**

The start date and time of the request, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z). The default is to start fulfilling the request immediately.

Type: Timestamp

Required: No

**validUntil**

The end date and time of the request, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z). At this point, no new instance requests are placed or able to fulfill the request. The default end date is 7 days from the current date.

Type: Timestamp

Required: No

# FleetEbsBlockDeviceRequest

Describes a block device for an EBS volume.

## Contents

**DeleteOnTermination**

Indicates whether the EBS volume is deleted on instance termination. For more information, see Preserve data when an instance is terminated in the *Amazon EC2 User Guide*.

Type: Boolean

Required: No

**Encrypted**

Indicates whether the encryption state of an EBS volume is changed while being restored from a backing snapshot. The effect of setting the encryption state to `true` depends on the volume origin (new or from a snapshot), starting encryption state, ownership, and whether encryption by default is enabled. For more information, see Amazon EBS encryption in the *Amazon EBS User Guide*.

In no case can you remove encryption from an encrypted volume.

Encrypted volumes can only be attached to instances that support Amazon EBS encryption. For more information, see Supported instance types.

This parameter is not returned by DescribeImageAttribute.

For CreateImage and RegisterImage, whether you can include this parameter, and the allowed values differ depending on the type of block device mapping you are creating.

- If you are creating a block device mapping for a **new (empty) volume**, you can include this parameter, and specify either `true` for an encrypted volume, or `false` for an unencrypted volume. If you omit this parameter, it defaults to `false` (unencrypted).
- If you are creating a block device mapping from an **existing encrypted or unencrypted snapshot**, you must omit this parameter. If you include this parameter, the request will fail, regardless of the value that you specify.
- If you are creating a block device mapping from an **existing unencrypted volume**, you can include this parameter, but you must specify `false`. If you specify `true`, the request will fail. In this case, we recommend that you omit the parameter.

- If you are creating a block device mapping from an **existing encrypted volume**, you can include this parameter, and specify either `true` or `false`. However, if you specify `false`, the parameter is ignored and the block device mapping is always encrypted. In this case, we recommend that you omit the parameter.

Type: Boolean

Required: No

**Iops**

The number of I/O operations per second (IOPS). For `gp3`, `io1`, and `io2` volumes, this represents the number of IOPS that are provisioned for the volume. For `gp2` volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting.

The following are the supported values for each volume type:

- `gp3`: 3,000 - 80,000 IOPS
- `io1`: 100 - 64,000 IOPS
- `io2`: 100 - 256,000 IOPS

For `io2` volumes, you can achieve up to 256,000 IOPS on instances built on the Nitro System. On other instances, you can achieve performance up to 32,000 IOPS.

This parameter is required for `io1` and `io2` volumes. The default for `gp3` volumes is 3,000 IOPS.

Type: Integer

Required: No

**KmsKeyId**

Identifier (key ID, key alias, key ARN, or alias ARN) of the customer managed KMS key to use for EBS encryption.

This parameter is only supported on `BlockDeviceMapping` objects called by CreateFleet, RequestSpotInstances, and RunInstances.

Type: String

Required: No

**SnapshotId**

The ID of the snapshot.

Type: String

Required: No

**Throughput**

The throughput that the volume supports, in MiB/s.

This parameter is valid only for gp3 volumes.

Valid Range: Minimum value of 125. Maximum value of 2,000.

Type: Integer

Required: No

**VolumeSize**

The size of the volume, in GiBs. You must specify either a snapshot ID or a volume size. If you specify a snapshot, the default is the snapshot size. You can specify a volume size that is equal to or larger than the snapshot size.

The following are the supported sizes for each volume type:

- gp2: 1 - 16,384 GiB
- gp3: 1 - 65,536 GiB
- io1: 4 - 16,384 GiB
- io2: 4 - 65,536 GiB
- st1 and sc1: 125 - 16,384 GiB
- standard: 1 - 1024 GiB

Type: Integer

Required: No

**VolumeType**

The volume type. For more information, see Amazon EBS volume types in the *Amazon EBS User Guide*.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FleetLaunchTemplateConfig

Describes a launch template and overrides.

## Contents

**launchTemplateSpecification**

The launch template.

Type: FleetLaunchTemplateSpecification object

Required: No

**Overrides.N**

Any parameters that you specify override the same parameters in the launch template.

Type: Array of FleetLaunchTemplateOverrides objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FleetLaunchTemplateConfigRequest

Describes a launch template and overrides.

## Contents

**LaunchTemplateSpecification**

The launch template to use. You must specify either the launch template ID or launch template name in the request.

Type: FleetLaunchTemplateSpecificationRequest object

Required: No

**Overrides.N**

Any parameters that you specify override the same parameters in the launch template.

For fleets of type `request` and `maintain`, a maximum of 300 items is allowed across all launch templates.

Type: Array of FleetLaunchTemplateOverridesRequest objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FleetLaunchTemplateOverrides

Describes overrides for a launch template.

## Contents

**availabilityZone**

The Availability Zone in which to launch the instances. For example, `us-east-2a`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone in which to launch the instances. For example, `use2-az1`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: String

Required: No

**BlockDeviceMappingSet.N**

The block device mappings, which define the EBS volumes and instance store volumes to attach to the instance at launch.

Supported only for fleets of type `instant`.

For more information, see Block device mappings for volumes on Amazon EC2 instances in the *Amazon EC2 User Guide*.

Type: Array of BlockDeviceMappingResponse objects

Required: No

**imageId**

The ID of the AMI in the format `ami-17characters00000`.

Alternatively, you can specify a Systems Manager parameter, using one of the following formats. The Systems Manager parameter will resolve to an AMI ID on launch.

To reference a public parameter:

- `resolve:ssm:public-parameter`

To reference a parameter stored in the same account:

- `resolve:ssm:parameter-name`
- `resolve:ssm:parameter-name:version-number`
- `resolve:ssm:parameter-name:label`

To reference a parameter shared from another AWS account:

- `resolve:ssm:parameter-ARN`
- `resolve:ssm:parameter-ARN:version-number`
- `resolve:ssm:parameter-ARN:label`

For more information, see Use a Systems Manager parameter instead of an AMI ID in the *Amazon EC2 User Guide*.

> **Note**
>
> This parameter is only available for fleets of type `instant`. For fleets of type `maintain` and `request`, you must specify the AMI ID in the launch template.

Type: String

Required: No

**instanceRequirements**

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with those attributes.

> **Note**
>
> If you specify `InstanceRequirements`, you can't specify `InstanceType`.

Type: InstanceRequirements object

Required: No

**instanceType**

The instance type.

`mac1.metal` is not supported as a launch template override.

> **Note**
>
> If you specify `InstanceType`, you can't specify `InstanceRequirements`.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge`

Required: No

**maxPrice**

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.
> If you specify a maximum price, it must be more than USD $0.001. Specifying a value below USD $0.001 will result in an `InvalidParameterValue` error message.

Type: String

Required: No

**placement**

The location where the instance launched, if applicable.

Type: PlacementResponse object

Required: No

**priority**

The priority for the launch template override. The highest priority is launched first.

If the On-Demand `AllocationStrategy` is set to `prioritized`, EC2 Fleet uses priority to determine which launch template override to use first in fulfilling On-Demand capacity.

If the Spot `AllocationStrategy` is set to `capacity-optimized-prioritized`, EC2 Fleet uses priority on a best-effort basis to determine which launch template override to use in fulfilling Spot capacity, but optimizes for capacity first.

Valid values are whole numbers starting at `0`. The lower the number, the higher the priority. If no number is set, the override has the lowest priority. You can set the same priority for different launch template overrides.

Type: Double

Required: No

**subnetId**

The ID of the subnet in which to launch the instances.

Type: String

Required: No

**weightedCapacity**

The number of units provided by the specified instance type. These are the same units that you chose to set the target capacity in terms of instances, or a performance characteristic such as vCPUs, memory, or I/O.

If the target capacity divided by this value is not a whole number, Amazon EC2 rounds the number of instances to the next whole number. If this value is not specified, the default is 1.

> **Note**
>
> When specifying weights, the price used in the `lowest-price` and `price-capacity-optimized` allocation strategies is per *unit* hour (where the instance price is divided by the specified weight). However, if all the specified weights are above the requested `TargetCapacity`, resulting in only 1 instance being launched, the price used is per *instance* hour.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FleetLaunchTemplateOverridesRequest

Describes overrides for a launch template.

## Contents

**AvailabilityZone**

The Availability Zone in which to launch the instances. For example, `us-east-2a`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: String

Required: No

**AvailabilityZoneId**

The ID of the Availability Zone in which to launch the instances. For example, `use2-az1`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: String

Required: No

**BlockDeviceMapping.N**

The block device mappings, which define the EBS volumes and instance store volumes to attach to the instance at launch.

Supported only for fleets of type `instant`.

For more information, see Block device mappings for volumes on Amazon EC2 instances in the *Amazon EC2 User Guide*.

Type: Array of FleetBlockDeviceMappingRequest objects

Required: No

**ImageId**

The ID of the AMI in the format `ami-17characters00000`.

Alternatively, you can specify a Systems Manager parameter, using one of the following formats. The Systems Manager parameter will resolve to an AMI ID on launch.

To reference a public parameter:

- `resolve:ssm:public-parameter`

To reference a parameter stored in the same account:

- `resolve:ssm:parameter-name`
- `resolve:ssm:parameter-name:version-number`
- `resolve:ssm:parameter-name:label`

To reference a parameter shared from another AWS account:

- `resolve:ssm:parameter-ARN`
- `resolve:ssm:parameter-ARN:version-number`
- `resolve:ssm:parameter-ARN:label`

For more information, see Use a Systems Manager parameter instead of an AMI ID in the *Amazon EC2 User Guide*.

> **Note**
>
> This parameter is only available for fleets of type `instant`. For fleets of type `maintain` and `request`, you must specify the AMI ID in the launch template.

Type: String

Required: No

**InstanceRequirements**

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with those attributes.

> **Note**
>
> If you specify `InstanceRequirements`, you can't specify `InstanceType`.

Type: InstanceRequirementsRequest object

Required: No

**InstanceType**

The instance type.

`mac1.metal` is not supported as a launch template override.

> **Note**
>
> If you specify `InstanceType`, you can't specify `InstanceRequirements`.

Type: String

Required: No

**MaxPrice**

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.
> If you specify a maximum price, it must be more than USD $0.001. Specifying a value below USD $0.001 will result in an `InvalidParameterValue` error message.

Type: String

Required: No

**Placement**

The location where the instance launched, if applicable.

Type: Placement object

Required: No

**Priority**

The priority for the launch template override. The highest priority is launched first.

If the On-Demand `AllocationStrategy` is set to `prioritized`, EC2 Fleet uses priority to determine which launch template override to use first in fulfilling On-Demand capacity.

If the Spot `AllocationStrategy` is set to `capacity-optimized-prioritized`, EC2 Fleet uses priority on a best-effort basis to determine which launch template override to use in fulfilling Spot capacity, but optimizes for capacity first.

Valid values are whole numbers starting at `0`. The lower the number, the higher the priority. If no number is set, the launch template override has the lowest priority. You can set the same priority for different launch template overrides.

Type: Double

Required: No

**SubnetId**

The IDs of the subnets in which to launch the instances. Separate multiple subnet IDs using commas (for example, `subnet-1234abcdeexample1, subnet-0987cdef6example2`). A request of type `instant` can have only one subnet ID.

Type: String

Required: No

**WeightedCapacity**

The number of units provided by the specified instance type. These are the same units that you chose to set the target capacity in terms of instances, or a performance characteristic such as vCPUs, memory, or I/O.

If the target capacity divided by this value is not a whole number, Amazon EC2 rounds the number of instances to the next whole number. If this value is not specified, the default is 1.

> **Note**
>
> When specifying weights, the price used in the `lowest-price` and `price-capacity-optimized` allocation strategies is per *unit* hour (where the instance price is divided by the specified weight). However, if all the specified weights are above the requested `TargetCapacity`, resulting in only 1 instance being launched, the price used is per *instance* hour.

Type: Double

Required: No

## See Also

# FleetLaunchTemplateSpecification

The Amazon EC2 launch template that can be used by a Spot Fleet to configure Amazon EC2 instances. You must specify either the ID or name of the launch template in the request, but not both.

For information about launch templates, see Launch an instance from a launch template in the *Amazon EC2 User Guide*.

## Contents

**LaunchTemplateId** (request), **launchTemplateId** (response)

The ID of the launch template.

You must specify the `LaunchTemplateId` or the `LaunchTemplateName`, but not both.

Type: String

Required: No

**LaunchTemplateName** (request), **launchTemplateName** (response)

The name of the launch template.

You must specify the `LaunchTemplateName` or the `LaunchTemplateId`, but not both.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

**Version** (request), **version** (response)

The launch template version number, `$Latest`, or `$Default`. You must specify a value, otherwise the request fails.

If the value is `$Latest`, Amazon EC2 uses the latest version of the launch template.

If the value is `$Default`, Amazon EC2 uses the default version of the launch template.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FleetLaunchTemplateSpecificationRequest

The Amazon EC2 launch template that can be used by an EC2 Fleet to configure Amazon EC2 instances. You must specify either the ID or name of the launch template in the request, but not both.

For information about launch templates, see Launch an instance from a launch template in the *Amazon EC2 User Guide*.

## Contents

**LaunchTemplateId**

The ID of the launch template.

You must specify the `LaunchTemplateId` or the `LaunchTemplateName`, but not both.

Type: String

Required: No

**LaunchTemplateName**

The name of the launch template.

You must specify the `LaunchTemplateName` or the `LaunchTemplateId`, but not both.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

**Version**

The launch template version number, `$Latest`, or `$Default`. You must specify a value, otherwise the request fails.

If the value is `$Latest`, Amazon EC2 uses the latest version of the launch template.

If the value is `$Default`, Amazon EC2 uses the default version of the launch template.

Type: String

Required: No

# FleetSpotCapacityRebalance

The strategy to use when Amazon EC2 emits a signal that your Spot Instance is at an elevated risk of being interrupted.

## Contents

**replacementStrategy**

The replacement strategy to use. Only available for fleets of type `maintain`.

`launch` - EC2 Fleet launches a new replacement Spot Instance when a rebalance notification is emitted for an existing Spot Instance in the fleet. EC2 Fleet does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

`launch-before-terminate` - EC2 Fleet launches a new replacement Spot Instance when a rebalance notification is emitted for an existing Spot Instance in the fleet, and then, after a delay that you specify (in `TerminationDelay`), terminates the instances that received a rebalance notification.

Type: String

Valid Values: `launch | launch-before-terminate`

Required: No

**terminationDelay**

The amount of time (in seconds) that Amazon EC2 waits before terminating the old Spot Instance after launching a new replacement Spot Instance.

Required when `ReplacementStrategy` is set to `launch-before-terminate`.

Not valid when `ReplacementStrategy` is set to `launch`.

Valid values: Minimum value of `120` seconds. Maximum value of `7200` seconds.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

# FleetSpotCapacityRebalanceRequest

The Spot Instance replacement strategy to use when Amazon EC2 emits a rebalance notification signal that your Spot Instance is at an elevated risk of being interrupted. For more information, see Capacity rebalancing in the *Amazon EC2 User Guide*.

## Contents

**ReplacementStrategy**

The replacement strategy to use. Only available for fleets of type `maintain`.

`launch` - EC2 Fleet launches a replacement Spot Instance when a rebalance notification is emitted for an existing Spot Instance in the fleet. EC2 Fleet does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

`launch-before-terminate` - EC2 Fleet launches a replacement Spot Instance when a rebalance notification is emitted for an existing Spot Instance in the fleet, and then, after a delay that you specify (in `TerminationDelay`), terminates the instances that received a rebalance notification.

Type: String

Valid Values: `launch | launch-before-terminate`

Required: No

**TerminationDelay**

The amount of time (in seconds) that Amazon EC2 waits before terminating the old Spot Instance after launching a new replacement Spot Instance.

Required when `ReplacementStrategy` is set to `launch-before-terminate`.

Not valid when `ReplacementStrategy` is set to `launch`.

Valid values: Minimum value of `120` seconds. Maximum value of `7200` seconds.

Type: Integer

Required: No

# FleetSpotMaintenanceStrategies

The strategies for managing your Spot Instances that are at an elevated risk of being interrupted.

## Contents

**capacityRebalance**

The strategy to use when Amazon EC2 emits a signal that your Spot Instance is at an elevated risk of being interrupted.

Type: FleetSpotCapacityRebalance object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FleetSpotMaintenanceStrategiesRequest

The strategies for managing your Spot Instances that are at an elevated risk of being interrupted.

## Contents

### CapacityRebalance

The strategy to use when Amazon EC2 emits a signal that your Spot Instance is at an elevated risk of being interrupted.

Type: FleetSpotCapacityRebalanceRequest object

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FlowLog

Describes a flow log.

## Contents

**creationTime**

The date and time the flow log was created.

Type: Timestamp

Required: No

**deliverCrossAccountRole**

The ARN of the IAM role that allows the service to publish flow logs across accounts.

Type: String

Required: No

**deliverLogsErrorMessage**

Information about the error that occurred. `Rate limited` indicates that CloudWatch Logs throttling has been applied for one or more network interfaces, or that you've reached the limit on the number of log groups that you can create. `Access error` indicates that the IAM role associated with the flow log does not have sufficient permissions to publish to CloudWatch Logs. `Unknown error` indicates an internal error.

Type: String

Required: No

**deliverLogsPermissionArn**

The ARN of the IAM role allows the service to publish logs to CloudWatch Logs.

Type: String

Required: No

**deliverLogsStatus**

The status of the logs delivery (`SUCCESS` | `FAILED`).

Type: String

Required: No

**destinationOptions**

The destination options.

Type: DestinationOptionsResponse object

Required: No

**flowLogId**

The ID of the flow log.

Type: String

Required: No

**flowLogStatus**

The status of the flow log (`ACTIVE`).

Type: String

Required: No

**logDestination**

The Amazon Resource Name (ARN) of the destination for the flow log data.

Type: String

Required: No

**logDestinationType**

The type of destination for the flow log data.

Type: String

Valid Values: `cloud-watch-logs | s3 | kinesis-data-firehose`

Required: No

**logFormat**

The format of the flow log record.

Type: String

Required: No

**logGroupName**

The name of the flow log group.

Type: String

Required: No

**maxAggregationInterval**

The maximum interval of time, in seconds, during which a flow of packets is captured and aggregated into a flow log record.

When a network interface is attached to a Nitro-based instance, the aggregation interval is always 60 seconds (1 minute) or less, regardless of the specified value.

Valid Values: `60` | `600`

Type: Integer

Required: No

**resourceId**

The ID of the resource being monitored.

Type: String

Required: No

**TagFieldSpecificationSet.N**

The tag configuration associated with the Flow Logs Amazon EC2 Tags feature fields in your custom log format.

Type: Array of TagFieldSpecificationResponse objects

Array Members: Minimum number of 1 item. Maximum number of 3 items.

Required: No

**TagSet.N**

The tags for the flow log.

Type: Array of Tag objects

Required: No

**trafficType**

The type of traffic captured for the flow log.

Type: String

Valid Values: `ACCEPT | REJECT | ALL`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FpgaDeviceInfo

Describes the FPGA accelerator for the instance type.

## Contents

**count**

The count of FPGA accelerators for the instance type.

Type: Integer

Required: No

**manufacturer**

The manufacturer of the FPGA accelerator.

Type: String

Required: No

**memoryInfo**

Describes the memory for the FPGA accelerator for the instance type.

Type: FpgaDeviceMemoryInfo object

Required: No

**name**

The name of the FPGA accelerator.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FpgaDeviceMemoryInfo

Describes the memory for the FPGA accelerator for the instance type.

## Contents

**sizeInMiB**

The size of the memory available to the FPGA accelerator, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FpgaImage

Describes an Amazon FPGA image (AFI).

## Contents

**createTime**

The date and time the AFI was created.

Type: Timestamp

Required: No

**dataRetentionSupport**

Indicates whether data retention support is enabled for the AFI.

Type: Boolean

Required: No

**description**

The description of the AFI.

Type: String

Required: No

**fpgaImageGlobalId**

The global FPGA image identifier (AGFI ID).

Type: String

Required: No

**fpgaImageId**

The FPGA image identifier (AFI ID).

Type: String

Required: No

**InstanceTypes.N**

The instance types supported by the AFI.

Type: Array of strings

Required: No

**name**

The name of the AFI.

Type: String

Required: No

**ownerAlias**

The alias of the AFI owner. Possible values include `self`, `amazon`, and `aws-marketplace`.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the AFI.

Type: String

Required: No

**pciId**

Information about the PCI bus.

Type: PciId object

Required: No

**ProductCodes.N**

The product codes for the AFI.

Type: Array of ProductCode objects

Required: No

**public**

Indicates whether the AFI is public.

Type: Boolean

Required: No

**shellVersion**

The version of the AWS Shell that was used to create the bitstream.

Type: String

Required: No

**state**

Information about the state of the AFI.

Type: FpgaImageState object

Required: No

**Tags.N**

Any tags assigned to the AFI.

Type: Array of Tag objects

Required: No

**updateTime**

The time of the most recent update to the AFI.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FpgaImageAttribute

Describes an Amazon FPGA image (AFI) attribute.

## Contents

**description**

The description of the AFI.

Type: String

Required: No

**fpgaImageId**

The ID of the AFI.

Type: String

Required: No

**LoadPermissions.N**

The load permissions.

Type: Array of LoadPermission objects

Required: No

**name**

The name of the AFI.

Type: String

Required: No

**ProductCodes.N**

The product codes.

Type: Array of ProductCode objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FpgaImageState

Describes the state of the bitstream generation process for an Amazon FPGA image (AFI).

## Contents

**code**

The state. The following are the possible values:

- `pending` - AFI bitstream generation is in progress.
- `available` - The AFI is available for use.
- `failed` - AFI bitstream generation failed.
- `unavailable` - The AFI is no longer available for use.

Type: String

Valid Values: `pending | failed | available | unavailable`

Required: No

**message**

If the state is `failed`, this is the error message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# FpgaInfo

Describes the FPGAs for the instance type.

## Contents

**Fpgas.N**

Describes the FPGAs for the instance type.

Type: Array of FpgaDeviceInfo objects

Required: No

**totalFpgaMemoryInMiB**

The total memory of all FPGA accelerators for the instance type.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# GpuDeviceInfo

Describes the GPU accelerators for the instance type.

## Contents

**count**

The number of GPUs for the instance type.

Type: Integer

Required: No

**gpuPartitionSize**

The size of each GPU as a fraction of a full GPU, between 0 (excluded) and 1 (included).

Type: Double

Required: No

**logicalGpuCount**

Total number of GPU devices of this type.

Type: Integer

Required: No

**manufacturer**

The manufacturer of the GPU accelerator.

Type: String

Required: No

**memoryInfo**

Describes the memory available to the GPU accelerator.

Type: GpuDeviceMemoryInfo object

Required: No

**name**

The name of the GPU accelerator.

Type: String

Required: No

**WorkloadSet.N**

A list of workload types this GPU supports.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# GpuDeviceMemoryInfo

Describes the memory available to the GPU accelerator.

## Contents

**sizeInMiB**

The size of the memory available to the GPU accelerator, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# GpuInfo

Describes the GPU accelerators for the instance type.

## Contents

**Gpus.N**

Describes the GPU accelerators for the instance type.

Type: Array of GpuDeviceInfo objects

Required: No

**totalGpuMemoryInMiB**

The total size of the memory for the GPU accelerators for the instance type, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# GroupIdentifier

Describes a security group.

## Contents

**GroupId** (request), **groupId** (response)

The ID of the security group.

Type: String

Required: No

**GroupName** (request), **groupName** (response)

The name of the security group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# HibernationOptions

Indicates whether your instance is configured for hibernation. This parameter is valid only if the instance meets the hibernation prerequisites. For more information, see Hibernate your Amazon EC2 instance in the *Amazon EC2 User Guide*.

## Contents

**configured**

If `true`, your instance is enabled for hibernation; otherwise, it is not enabled for hibernation.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# HibernationOptionsRequest

Indicates whether your instance is configured for hibernation. This parameter is valid only if the instance meets the hibernation prerequisites. For more information, see Hibernate your Amazon EC2 instance in the *Amazon EC2 User Guide*.

## Contents

**Configured**

Set to `true` to enable your instance for hibernation.

For Spot Instances, if you set `Configured` to `true`, either omit the `InstanceInterruptionBehavior` parameter (for `SpotMarketOptions`), or set it to `hibernate`. When `Configured` is true:

- If you omit `InstanceInterruptionBehavior`, it defaults to `hibernate`.
- If you set `InstanceInterruptionBehavior` to a value other than `hibernate`, you'll get an error.

Default: `false`

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# HistoryRecord

Describes an event in the history of the Spot Fleet request.

## Contents

**eventInformation**

Information about the event.

Type: EventInformation object

Required: No

**eventType**

The event type.

- `error` - An error with the Spot Fleet request.
- `fleetRequestChange` - A change in the status or configuration of the Spot Fleet request.
- `instanceChange` - An instance was launched or terminated.
- `Information` - An informational event.

Type: String

Valid Values: `instanceChange | fleetRequestChange | error | information`

Required: No

**timestamp**

The date and time of the event, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# HistoryRecordEntry

Describes an event in the history of an EC2 Fleet.

## Contents

**eventInformation**

Information about the event.

Type: EventInformation object

Required: No

**eventType**

The event type.

Type: String

Valid Values: `instance-change | fleet-change | service-error`

Required: No

**timestamp**

The date and time of the event, in UTC format (for example, *YYYY*-*MM*-*DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Host

Describes the properties of the Dedicated Host.

## Contents

**allocationTime**

The time that the Dedicated Host was allocated.

Type: Timestamp

Required: No

**allowsMultipleInstanceTypes**

Indicates whether the Dedicated Host supports multiple instance types of the same instance family. If the value is `on`, the Dedicated Host supports multiple instance types in the instance family. If the value is `off`, the Dedicated Host supports a single instance type only.

Type: String

Valid Values: `on | off`

Required: No

**assetId**

The ID of the Outpost hardware asset on which the Dedicated Host is allocated.

Type: String

Required: No

**autoPlacement**

Whether auto-placement is on or off.

Type: String

Valid Values: `on | off`

Required: No

**availabilityZone**

The Availability Zone of the Dedicated Host.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone in which the Dedicated Host is allocated.

Type: String

Required: No

**availableCapacity**

Information about the instances running on the Dedicated Host.

Type: AvailableCapacity object

Required: No

**clientToken**

Unique, case-sensitive identifier that you provide to ensure the idempotency of the request. For more information, see Ensuring Idempotency.

Type: String

Required: No

**hostId**

The ID of the Dedicated Host.

Type: String

Required: No

**hostMaintenance**

Indicates whether host maintenance is enabled or disabled for the Dedicated Host.

Type: String

Valid Values: `on` | `off`

Required: No

**hostProperties**

The hardware specifications of the Dedicated Host.

Type: HostProperties object

Required: No

**hostRecovery**

Indicates whether host recovery is enabled or disabled for the Dedicated Host.

Type: String

Valid Values: `on` | `off`

Required: No

**hostReservationId**

The reservation ID of the Dedicated Host. This returns a `null` response if the Dedicated Host doesn't have an associated reservation.

Type: String

Required: No

**Instances.N**

The IDs and instance type that are currently running on the Dedicated Host.

Type: Array of HostInstance objects

Required: No

**memberOfServiceLinkedResourceGroup**

Indicates whether the Dedicated Host is in a host resource group. If **memberOfServiceLinkedResourceGroup** is `true`, the host is in a host resource group; otherwise, it is not.

Type: Boolean

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the AWS Outpost on which the Dedicated Host is allocated.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the Dedicated Host.

Type: String

Required: No

**releaseTime**

The time that the Dedicated Host was released.

Type: Timestamp

Required: No

**state**

The Dedicated Host's state.

Type: String

Valid Values: `available | under-assessment | permanent-failure | released | released-permanent-failure | pending`

Required: No

**TagSet.N**

Any tags assigned to the Dedicated Host.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# HostInstance

Describes an instance running on a Dedicated Host.

## Contents

**instanceId**

The ID of instance that is running on the Dedicated Host.

Type: String

Required: No

**instanceType**

The instance type (for example, `m3.medium`) of the running instance.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# HostOffering

Details about the Dedicated Host Reservation offering.

## Contents

**currencyCode**

The currency of the offering.

Type: String

Valid Values: USD

Required: No

**duration**

The duration of the offering (in seconds).

Type: Integer

Required: No

**hourlyPrice**

The hourly price of the offering.

Type: String

Required: No

**instanceFamily**

The instance family of the offering.

Type: String

Required: No

**offeringId**

The ID of the offering.

Type: String

Required: No

**paymentOption**

The available payment option.

Type: String

Valid Values: `AllUpfront | PartialUpfront | NoUpfront`

Required: No

**upfrontPrice**

The upfront price of the offering. Does not apply to No Upfront offerings.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# HostProperties

Describes the properties of a Dedicated Host.

## Contents

**cores**

The number of cores on the Dedicated Host.

Type: Integer

Required: No

**instanceFamily**

The instance family supported by the Dedicated Host. For example, `m5`.

Type: String

Required: No

**instanceType**

The instance type supported by the Dedicated Host. For example, `m5.large`. If the host supports multiple instance types, no **instanceType** is returned.

Type: String

Required: No

**sockets**

The number of sockets on the Dedicated Host.

Type: Integer

Required: No

**totalVCpus**

The total number of vCPUs on the Dedicated Host.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# HostReservation

Details about the Dedicated Host Reservation and associated Dedicated Hosts.

## Contents

**count**

The number of Dedicated Hosts the reservation is associated with.

Type: Integer

Required: No

**currencyCode**

The currency in which the `upfrontPrice` and `hourlyPrice` amounts are specified. At this time, the only supported currency is `USD`.

Type: String

Valid Values: `USD`

Required: No

**duration**

The length of the reservation's term, specified in seconds. Can be `31536000 (1 year)` | `94608000 (3 years)`.

Type: Integer

Required: No

**end**

The date and time that the reservation ends.

Type: Timestamp

Required: No

**HostIdSet.N**

The IDs of the Dedicated Hosts associated with the reservation.

Type: Array of strings

Required: No

**hostReservationId**

The ID of the reservation that specifies the associated Dedicated Hosts.

Type: String

Required: No

**hourlyPrice**

The hourly price of the reservation.

Type: String

Required: No

**instanceFamily**

The instance family of the Dedicated Host Reservation. The instance family on the Dedicated Host must be the same in order for it to benefit from the reservation.

Type: String

Required: No

**offeringId**

The ID of the reservation. This remains the same regardless of which Dedicated Hosts are associated with it.

Type: String

Required: No

**paymentOption**

The payment option selected for this reservation.

Type: String

Valid Values: `AllUpfront | PartialUpfront | NoUpfront`

Required: No

**start**

The date and time that the reservation started.

Type: Timestamp

Required: No

**state**

The state of the reservation.

Type: String

Valid Values: `active | expired | cancelled | scheduled | pending | failed | delayed | unsupported | payment-pending | payment-failed | retired`

Required: No

**TagSet.N**

Any tags assigned to the Dedicated Host Reservation.

Type: Array of Tag objects

Required: No

**upfrontPrice**

The upfront price of the reservation.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IamInstanceProfile

Describes an IAM instance profile.

## Contents

**arn**

The Amazon Resource Name (ARN) of the instance profile.

Type: String

Required: No

**id**

The ID of the instance profile.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IamInstanceProfileAssociation

Describes an association between an IAM instance profile and an instance.

## Contents

**associationId**

The ID of the association.

Type: String

Required: No

**iamInstanceProfile**

The IAM instance profile.

Type: IamInstanceProfile object

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**state**

The state of the association.

Type: String

Valid Values: `associating | associated | disassociating | disassociated`

Required: No

**timestamp**

The time the IAM instance profile was associated with the instance.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IamInstanceProfileSpecification

Describes an IAM instance profile.

## Contents

**Arn** (request), **arn** (response)

The Amazon Resource Name (ARN) of the instance profile.

Type: String

Required: No

**Name** (request), **name** (response)

The name of the instance profile.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IcmpTypeCode

Describes the ICMP type and code.

## Contents

**Code** (request), **code** (response)

The ICMP code. A value of -1 means all codes for the specified ICMP type.

Type: Integer

Required: No

**Type** (request), **type** (response)

The ICMP type. A value of -1 means all types.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IdFormat

Describes the ID format for a resource.

## Contents

**deadline**

The date in UTC at which you are permanently switched over to using longer IDs. If a deadline is not yet available for this resource type, this field is not returned.

Type: Timestamp

Required: No

**resource**

The type of resource.

Type: String

Required: No

**useLongIds**

Indicates whether longer IDs (17-character IDs) are enabled for the resource.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IKEVersionsListValue

The internet key exchange (IKE) version permitted for the VPN tunnel.

## Contents

**value**

The IKE version.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IKEVersionsRequestListValue

The IKE version that is permitted for the VPN tunnel.

## Contents

### Value

The IKE version.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Image

Describes an image.

## Contents

**architecture**

The architecture of the image.

Type: String

Valid Values: `i386 | x86_64 | arm64 | x86_64_mac | arm64_mac`

Required: No

**BlockDeviceMapping.N**

Any block device mapping entries.

Type: Array of BlockDeviceMapping objects

Required: No

**bootMode**

The boot mode of the image. For more information, see Instance launch behavior with Amazon EC2 boot modes in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `legacy-bios | uefi | uefi-preferred`

Required: No

**creationDate**

The date and time the image was created.

Type: String

Required: No

**deprecationTime**

The date and time to deprecate the AMI, in UTC, in the following format: *YYYY-MM-DD*T*HH*:*MM*:*SS*Z. If you specified a value for seconds, Amazon EC2 rounds the seconds to the nearest minute.

Type: String

Required: No

**deregistrationProtection**

Indicates whether deregistration protection is enabled for the AMI.

Type: String

Required: No

**description**

The description of the AMI that was provided during image creation.

Type: String

Required: No

**enaSupport**

Specifies whether enhanced networking with ENA is enabled.

Type: Boolean

Required: No

**freeTierEligible**

Indicates whether the image is eligible for AWS Free Tier.

- If `true`, the AMI is eligible for Free Tier and can be used to launch instances under the Free Tier limits.
- If `false`, the AMI is not eligible for Free Tier.

Type: Boolean

Required: No

**hypervisor**

The hypervisor type of the image. Only `xen` is supported. `ovm` is not supported.

Type: String

Valid Values: `ovm | xen`

Required: No

**imageAllowed**

If `true`, the AMI satisfies the criteria for Allowed AMIs and can be discovered and used in the account. If `false` and Allowed AMIs is set to `enabled`, the AMI can't be discovered or used in the account. If `false` and Allowed AMIs is set to `audit-mode`, the AMI can be discovered and used in the account.

For more information, see Control the discovery and use of AMIs in Amazon EC2 with Allowed AMIs in *Amazon EC2 User Guide*.

Type: Boolean

Required: No

**imageId**

The ID of the AMI.

Type: String

Required: No

**imageLocation**

The location of the AMI.

Type: String

Required: No

**imageOwnerAlias**

The owner alias (`amazon | aws-backup-vault | aws-marketplace`).

Type: String

Required: No

**imageOwnerId**

The ID of the AWS account that owns the image.

Type: String

Required: No

**imageState**

The current state of the AMI. If the state is `available`, the image is successfully registered and can be used to launch an instance.

Type: String

Valid Values: `pending | available | invalid | deregistered | transient | failed | error | disabled`

Required: No

**imageType**

The type of image.

Type: String

Valid Values: `machine | kernel | ramdisk`

Required: No

**ImageWatermarkSet.N**

The watermarks attached to the AMI.

Type: Array of ImageWatermark objects

Required: No

**imdsSupport**

If `v2.0`, it indicates that IMDSv2 is specified in the AMI. Instances launched from this AMI will have `HttpTokens` automatically set to `required` so that, by default, the instance requires that IMDSv2 is used when requesting instance metadata. In addition, `HttpPutResponseHopLimit` is set to 2. For more information, see Configure the AMI in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `v2.0`

Required: No

**isPublic**

Indicates whether the image has public launch permissions. The value is `true` if this image has public launch permissions or `false` if it has only implicit and explicit launch permissions.

Type: Boolean

Required: No

**kernelId**

The kernel associated with the image, if any. Only applicable for machine images.

Type: String

Required: No

**lastLaunchedTime**

The date and time, in ISO 8601 date-time format, when the AMI was last used to launch an EC2 instance. When the AMI is used to launch an instance, there is a 24-hour delay before that usage is reported.

> **Note**
>
> `lastLaunchedTime` data is available starting April 2017.

Type: String

Required: No

**name**

The name of the AMI that was provided during image creation.

Type: String

Required: No

**platform**

This value is set to `windows` for Windows AMIs; otherwise, it is blank.

Type: String

Valid Values: `Windows`

Required: No

**platformDetails**

The platform details associated with the billing code of the AMI. For more information, see Understand AMI billing information in the *Amazon EC2 User Guide*.

Type: String

Required: No

**ProductCodes.N**

Any product codes associated with the AMI.

Type: Array of ProductCode objects

Required: No

**ramdiskId**

The RAM disk associated with the image, if any. Only applicable for machine images.

Type: String

Required: No

**rootDeviceName**

The device name of the root device volume (for example, `/dev/sda1`).

Type: String

Required: No

**rootDeviceType**

The type of root device used by the AMI. The AMI can use an Amazon EBS volume or an instance store volume.

Type: String

Valid Values: `ebs | instance-store`

Required: No

**sourceImageId**

The ID of the source AMI from which the AMI was created.

The ID only appears if the AMI was created using CreateImage, CopyImage, or CreateRestoreImageTask. The ID does not appear if the AMI was created using any other API. For some older AMIs, the ID might not be available. For more information, see Identify the source AMI used to create a new Amazon EC2 AMI in the *Amazon EC2 User Guide*.

Type: String

Required: No

**sourceImageRegion**

The Region of the source AMI.

The Region only appears if the AMI was created using CreateImage, CopyImage, or CreateRestoreImageTask. The Region does not appear if the AMI was created using any other API. For some older AMIs, the Region might not be available. For more information, see Identify the source AMI used to create a new Amazon EC2 AMI in the *Amazon EC2 User Guide*.

Type: String

Required: No

**sourceInstanceId**

The ID of the instance that the AMI was created from if the AMI was created using CreateImage. This field only appears if the AMI was created using CreateImage.

Type: String

Required: No

**sriovNetSupport**

Specifies whether enhanced networking with the Intel 82599 Virtual Function interface is enabled.

Type: String

Required: No

**stateReason**

The reason for the state change.

Type: StateReason object

Required: No

**TagSet.N**

Any tags assigned to the image.

Type: Array of Tag objects

Required: No

**tpmSupport**

If the image is configured for NitroTPM support, the value is `v2.0`. For more information, see NitroTPM in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `v2.0`

Required: No

**usageOperation**

The operation of the Amazon EC2 instance and the billing code that is associated with the AMI. `usageOperation` corresponds to the lineitem/Operation column on your AWS Cost and Usage Report and in the AWS Price List API. You can view these fields on the **Instances** or **AMIs** pages in the Amazon EC2 console, or in the responses that are returned by the DescribeImages command in the Amazon EC2 API, or the describe-images command in the AWS CLI.

Type: String

Required: No

**virtualizationType**

The type of virtualization of the AMI.

Type: String

Valid Values: `hvm | paravirtual`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageAncestryEntry

Information about a single AMI in the ancestry chain and its source (parent) AMI.

## Contents

**creationDate**

The date and time when this AMI was created.

Type: Timestamp

Required: No

**imageId**

The ID of this AMI.

Type: String

Required: No

**imageOwnerAlias**

The owner alias (`amazon` | `aws-backup-vault` | `aws-marketplace` ) of this AMI, if one is assigned. Otherwise, the value is `null`.

Type: String

Required: No

**sourceImageId**

The ID of the parent AMI.

Type: String

Required: No

**sourceImageRegion**

The AWS Region of the parent AMI.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageCriterion

The criteria that are evaluated to determine which AMIs are discoverable and usable in your account for the specified AWS Region.

For more information, see How Allowed AMIs works in the *Amazon EC2 User Guide*.

## Contents

**creationDateCondition**

The maximum age for allowed images.

Type: CreationDateCondition object

Required: No

**deprecationTimeCondition**

The maximum period since deprecation for allowed images.

Type: DeprecationTimeCondition object

Required: No

**ImageNameSet.N**

The names of allowed images. Names can include wildcards (? and *).

Length: 1–128 characters. With ?, the minimum is 3 characters.

Valid characters:

- Letters: `A-Z, a-z`
- Numbers: `0-9`
- Special characters: `( ) [ ] . / - ' @ _ * ?`
- Spaces

Maximum: 50 values

Type: Array of strings

Required: No

**ImageProviderSet.N**

The image providers whose images are allowed.

Possible values:

- `amazon`: Allow AMIs created by Amazon or verified providers.
- `aws-marketplace`: Allow AMIs created by verified providers in the AWS Marketplace.
- `aws-backup-vault`: Allow AMIs created by AWS Backup.
- 12-digit account ID: Allow AMIs created by this account. One or more account IDs can be specified.
- none: Allow AMIs created by your own account only.

Maximum: 200 values

Type: Array of strings

Required: No

**MarketplaceProductCodeSet.N**

The AWS Marketplace product codes for allowed images.

Length: 1-25 characters

Valid characters: Letters (`A-Z, a-z`) and numbers (`0-9`)

Maximum: 50 values

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageCriterionRequest

The criteria that are evaluated to determine which AMIs are discoverable and usable in your account for the specified AWS Region.

The `ImageCriteria` can include up to:

- 10 `ImageCriterion`

Each `ImageCriterion` can include up to:

- 200 values for `ImageProviders`
- 50 values for `ImageNames`
- 50 values for `MarketplaceProductCodes`

For more information, see How Allowed AMIs works in the *Amazon EC2 User Guide*.

## Contents

**CreationDateCondition**

The maximum age for allowed images.

Type: CreationDateConditionRequest object

Required: No

**DeprecationTimeCondition**

The maximum period since deprecation for allowed images.

Type: DeprecationTimeConditionRequest object

Required: No

**ImageName.N**

The names of allowed images. Names can include wildcards (? and *).

Length: 1–128 characters. With ?, the minimum is 3 characters.

Valid characters:

- Letters: A–Z, a–z
- Numbers: 0–9
- Special characters: ( ) [ ] . / - ' @ _ * ?
- Spaces

Maximum: 50 values

Type: Array of strings

Required: No

**ImageProvider.N**

The image providers whose images are allowed.

Possible values:

- amazon: Allow AMIs created by Amazon or verified providers.
- aws-marketplace: Allow AMIs created by verified providers in the AWS Marketplace.
- aws-backup-vault: Allow AMIs created by AWS Backup.
- 12-digit account ID: Allow AMIs created by the specified accounts. One or more account IDs can be specified.
- none: Allow AMIs created by your own account only. When none is specified, no other values can be specified.

Maximum: 200 values

Type: Array of strings

Required: No

**MarketplaceProductCode.N**

The AWS Marketplace product codes for allowed images.

Length: 1-25 characters

Valid characters: Letters (A–Z, a–z) and numbers (0–9)

Maximum: 50 values

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageDiskContainer

Describes the disk container object for an import image task.

## Contents

**Description**

The description of the disk image.

Type: String

Required: No

**DeviceName**

The block device mapping for the disk.

Type: String

Required: No

**Format**

The format of the disk image being imported.

Valid values: `OVA` | `VHD` | `VHDX` | `VMDK` | `RAW`

Type: String

Required: No

**SnapshotId**

The ID of the EBS snapshot to be used for importing the snapshot.

Type: String

Required: No

**Url**

The URL to the Amazon S3-based disk image being imported. The URL can either be a https URL (https://..) or an Amazon S3 URL (s3://..)

Type: String

Required: No

**UserBucket**

The S3 bucket for the disk image.

Type: UserBucket object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageMetadata

Information about the AMI.

## Contents

**creationDate**

The date and time the AMI was created.

Type: String

Required: No

**deprecationTime**

The deprecation date and time of the AMI, in UTC, in the following format: *YYYY-MM-DD*T*HH*:*MM*:*SS*Z.

Type: String

Required: No

**imageAllowed**

If `true`, the AMI satisfies the criteria for Allowed AMIs and can be discovered and used in the account. If `false`, the AMI can't be discovered or used in the account.

For more information, see Control the discovery and use of AMIs in Amazon EC2 with Allowed AMIs in *Amazon EC2 User Guide*.

Type: Boolean

Required: No

**imageId**

The ID of the AMI.

Type: String

Required: No

**imageOwnerAlias**

The alias of the AMI owner.

Valid values: `amazon` | `aws-backup-vault` | `aws-marketplace`

Type: String

Required: No

**imageOwnerId**

The ID of the AWS account that owns the AMI.

Type: String

Required: No

**imageState**

The current state of the AMI. If the state is `available`, the AMI is successfully registered and can be used to launch an instance.

Type: String

Valid Values: `pending | available | invalid | deregistered | transient | failed | error | disabled`

Required: No

**ImageWatermarkSet.N**

The watermarks attached to the AMI.

Type: Array of ImageWatermark objects

Required: No

**isPublic**

Indicates whether the AMI has public launch permissions. A value of `true` means this AMI has public launch permissions, while `false` means it has only implicit (AMI owner) or explicit (shared with your account) launch permissions.

Type: Boolean

Required: No

**name**

The name of the AMI.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageRecycleBinInfo

Information about an AMI that is currently in the Recycle Bin.

## Contents

**description**

The description of the AMI.

Type: String

Required: No

**imageId**

The ID of the AMI.

Type: String

Required: No

**name**

The name of the AMI.

Type: String

Required: No

**recycleBinEnterTime**

The date and time when the AMI entered the Recycle Bin.

Type: Timestamp

Required: No

**recycleBinExitTime**

The date and time when the AMI is to be permanently deleted from the Recycle Bin.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageReference

A resource that is referencing an image.

## Contents

**arn**

The Amazon Resource Name (ARN) of the resource referencing the image.

Type: String

Required: No

**imageId**

The ID of the referenced image.

Type: String

Required: No

**resourceType**

The type of resource referencing the image.

Type: String

Valid Values: `ec2:Instance | ec2:LaunchTemplate | ssm:Parameter | imagebuilder:ImageRecipe | imagebuilder:ContainerRecipe`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageUsageReport

The configuration and status of an image usage report.

## Contents

**AccountIdSet.N**

The IDs of the AWS accounts that were specified when the report was created.

Type: Array of strings

Required: No

**creationTime**

The date and time when the report was created.

Type: Timestamp

Required: No

**expirationTime**

The date and time when Amazon EC2 will delete the report (30 days after the report was created).

Type: Timestamp

Required: No

**imageId**

The ID of the image that was specified when the report was created.

Type: String

Required: No

**reportId**

The ID of the report.

Type: String

Required: No

**ResourceTypeSet.N**

The resource types that were specified when the report was created.

Type: Array of ImageUsageResourceType objects

Required: No

**state**

The current state of the report. Possible values:

- `available` - The report is available to view.
- `pending` - The report is being created and not available to view.
- `error` - The report could not be created.

Type: String

Required: No

**stateReason**

Provides additional details when the report is in an `error` state.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the report.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# ImageUsageReportEntry

A single entry in an image usage report, detailing how an image is being used by a specific AWS account and resource type.

## Contents

**accountId**

The ID of the account that uses the image.

Type: String

Required: No

**imageId**

The ID of the image.

Type: String

Required: No

**reportCreationTime**

The date and time the report creation was initiated.

Type: Timestamp

Required: No

**reportId**

The ID of the report.

Type: String

Required: No

**resourceType**

The type of resource (`ec2:Instance` or `ec2:LaunchTemplate`).

Type: String

Required: No

**usageCount**

The number of times resources of this type reference this image in the account.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageUsageResourceType

A resource type to include in the report. Associated options can also be specified if the resource type is a launch template.

## Contents

**resourceType**

The resource type.

Valid values: `ec2:Instance` | `ec2:LaunchTemplate`

Type: String

Required: No

**ResourceTypeOptionSet.N**

The options that affect the scope of the report. Valid only when `ResourceType` is `ec2:LaunchTemplate`.

Type: Array of ImageUsageResourceTypeOption objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageUsageResourceTypeOption

The options that affect the scope of the report.

## Contents

**optionName**

The name of the option.

Type: String

Required: No

**OptionValueSet.N**

The number of launch template versions to check.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageUsageResourceTypeOptionRequest

The options that affect the scope of the report.

## Contents

**OptionName**

The name of the option.

Valid value: `version-depth` - The number of launch template versions to check.

Type: String

Required: No

**OptionValue.N**

A value for the specified option.

Valid values: Integers between 1 and `10000`

Default: `20`

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageUsageResourceTypeRequest

A resource type to include in the report. Associated options can also be specified if the resource type is a launch template.

## Contents

**ResourceType**

The resource type.

Valid values: `ec2:Instance` | `ec2:LaunchTemplate`

Type: String

Required: No

**ResourceTypeOption.N**

The options that affect the scope of the report. Valid only when `ResourceType` is `ec2:LaunchTemplate`.

Type: Array of ImageUsageResourceTypeOptionRequest objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImageWatermark

Describes a watermark attached to an AMI.

## Contents

**sourceImageCreationTime**

The creation date of the source AMI, in the following format: *YYYY-MM-DD*T*HH*:*MM*:*SS*.*ssssss*+*HH*:*MM*.

Type: Timestamp

Required: No

**sourceImageId**

The ID of the AMI to which the watermark was originally attached.

Type: String

Required: No

**sourceImageRegion**

The Region where the watermark was originally attached.

Type: String

Required: No

**watermarkCreationTime**

The date and time the watermark was attached to the AMI, in the following format: *YYYY-MM-DD*T*HH*:*MM*:*SS*.*ssssss*+*HH*:*MM*.

Type: Timestamp

Required: No

**watermarkKey**

The watermark identifier, in `accountId:watermarkName` format (for example, `123456789012:approvedAmi`). The `accountId` portion is the AWS account ID of the watermark creator. The `watermarkName` portion is customer-provided.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImportImageLicenseConfigurationRequest

The request information of license configurations.

## Contents

**LicenseConfigurationArn**

The ARN of a license configuration.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImportImageLicenseConfigurationResponse

The response information for license configurations.

## Contents

**licenseConfigurationArn**

The ARN of a license configuration.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImportImageTask

Describes an import image task.

## Contents

**architecture**

The architecture of the virtual machine.

Valid values: `i386` | `x86_64` | `arm64`

Type: String

Required: No

**bootMode**

The boot mode of the virtual machine.

Type: String

Valid Values: `legacy-bios | uefi | uefi-preferred`

Required: No

**description**

A description of the import task.

Type: String

Required: No

**encrypted**

Indicates whether the image is encrypted.

Type: Boolean

Required: No

**hypervisor**

The target hypervisor for the import task.

Valid values: xen

Type: String

Required: No

**imageId**

The ID of the Amazon Machine Image (AMI) of the imported virtual machine.

Type: String

Required: No

**importTaskId**

The ID of the import image task.

Type: String

Required: No

**kmsKeyId**

The identifier for the KMS key that was used to create the encrypted image.

Type: String

Required: No

**LicenseSpecifications.N**

The ARNs of the license configurations that are associated with the import image task.

Type: Array of ImportImageLicenseConfigurationResponse objects

Required: No

**licenseType**

The license type of the virtual machine.

Type: String

Required: No

**platform**

The description string for the import image task.

Type: String

Required: No

**progress**

The percentage of progress of the import image task.

Type: String

Required: No

**SnapshotDetailSet.N**

Information about the snapshots.

Type: Array of SnapshotDetail objects

Required: No

**status**

A brief status for the import image task.

Type: String

Required: No

**statusMessage**

A descriptive status message for the import image task.

Type: String

Required: No

**TagSet.N**

The tags for the import image task.

Type: Array of Tag objects

Required: No

**usageOperation**

The usage operation value.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImportInstanceLaunchSpecification

Describes the launch specification for VM import.

## Contents

**AdditionalInfo**

Reserved.

Type: String

Required: No

**Architecture**

The architecture of the instance.

Type: String

Valid Values: `i386 | x86_64 | arm64 | x86_64_mac | arm64_mac`

Required: No

**GroupId.N**

The security group IDs.

Type: Array of strings

Required: No

**GroupName.N**

The security group names.

Type: Array of strings

Required: No

**InstanceInitiatedShutdownBehavior**

Indicates whether an instance stops or terminates when you initiate shutdown from the instance (using the operating system command for system shutdown).

Type: String

Valid Values: `stop | terminate`

Required: No

**InstanceType**

The instance type. For more information about the instance types that you can import, see Instance Types in the VM Import/Export User Guide.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge | g4dn.xlarge | g4dn.2xlarge | g4dn.4xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.xlarge | g5.2xlarge | g5.4xlarge | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge |

`flex.xlarge | r8i-flex.2xlarge | r8i-flex.4xlarge | r8i-flex.8xlarge | r8i-flex.12xlarge | r8i-flex.16xlarge`

Required: No

**Monitoring**

Indicates whether monitoring is enabled.

Type: Boolean

Required: No

**Placement**

The placement information for the instance.

Type: Placement object

Required: No

**PrivateIpAddress**

[EC2-VPC] An available IP address from the IP address range of the subnet.

Type: String

Required: No

**SubnetId**

[EC2-VPC] The ID of the subnet in which to launch the instance.

Type: String

Required: No

**UserData**

The Base64-encoded user data to make available to the instance.

Type: UserData object

Required: No

# ImportInstanceTaskDetails

Describes an import instance task.

## Contents

**description**

A description of the task.

Type: String

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**platform**

The instance operating system.

Type: String

Valid Values: `Windows`

Required: No

**Volumes.N**

The volumes.

Type: Array of ImportInstanceVolumeDetailItem objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImportInstanceVolumeDetailItem

Describes an import volume task.

## Contents

**availabilityZone**

The Availability Zone where the resulting instance will reside.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone where the resulting instance will reside.

Type: String

Required: No

**bytesConverted**

The number of bytes converted so far.

Type: Long

Required: No

**description**

A description of the task.

Type: String

Required: No

**image**

The image.

Type: DiskImageDescription object

Required: No

**status**

The status of the import of this particular disk image.

Type: String

Required: No

**statusMessage**

The status information or errors related to the disk image.

Type: String

Required: No

**volume**

The volume.

Type: DiskImageVolumeDescription object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImportSnapshotTask

Describes an import snapshot task.

## Contents

**description**

A description of the import snapshot task.

Type: String

Required: No

**importTaskId**

The ID of the import snapshot task.

Type: String

Required: No

**snapshotTaskDetail**

Describes an import snapshot task.

Type: SnapshotTaskDetail object

Required: No

**TagSet.N**

The tags for the import snapshot task.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ImportVolumeTaskDetails

Describes an import volume task.

## Contents

**availabilityZone**

The Availability Zone where the resulting volume will reside.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone where the resulting volume will reside.

Type: String

Required: No

**bytesConverted**

The number of bytes converted so far.

Type: Long

Required: No

**description**

The description you provided when starting the import volume task.

Type: String

Required: No

**image**

The image.

Type: DiskImageDescription object

Required: No

**volume**

The volume.

Type: DiskImageVolumeDescription object

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InferenceAcceleratorInfo

> **Note**
>
> Amazon Elastic Inference is no longer available.

Describes the Inference accelerators for the instance type.

## Contents

**Accelerators.N**

Describes the Inference accelerators for the instance type.

Type: Array of InferenceDeviceInfo objects

Required: No

**totalInferenceMemoryInMiB**

The total size of the memory for the inference accelerators for the instance type, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InferenceDeviceInfo

> **Note**
>
> Amazon Elastic Inference is no longer available.

Describes the Inference accelerators for the instance type.

## Contents

**count**

The number of Inference accelerators for the instance type.

Type: Integer

Required: No

**manufacturer**

The manufacturer of the Inference accelerator.

Type: String

Required: No

**memoryInfo**

Describes the memory available to the inference accelerator.

Type: InferenceDeviceMemoryInfo object

Required: No

**name**

The name of the Inference accelerator.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InferenceDeviceMemoryInfo

> **Note**
>
> Amazon Elastic Inference is no longer available.

Describes the memory available to the inference accelerator.

## Contents

**sizeInMiB**

The size of the memory available to the inference accelerator, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InitializationStatusDetails

Information about the volume initialization. For more information, see Initialize Amazon EBS volumes.

## Contents

**estimatedTimeToCompleteInSeconds**

The estimated remaining time, in seconds, for volume initialization to complete. Returns `0` when volume initialization has completed.

Only available for volumes created with Amazon EBS Provisioned Rate for Volume Initialization.

Type: Long

Required: No

**initializationType**

The method used for volume initialization. Possible values include:

- `default` - Volume initialized using the default volume initialization rate or fast snapshot restore.
- `provisioned-rate` - Volume initialized using an Amazon EBS Provisioned Rate for Volume Initialization.
- `volume-copy` - Volume copy initialized at the rate for volume copies.

Type: String

Valid Values: `default | provisioned-rate | volume-copy`

Required: No

**progress**

The current volume initialization progress as a percentage (0-100). Returns `100` when volume initialization has completed.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Instance

Describes an instance.

## Contents

**amiLaunchIndex**

The AMI launch index, which can be used to find this instance in the launch group.

Type: Integer

Required: No

**architecture**

The architecture of the image.

Type: String

Valid Values: `i386 | x86_64 | arm64 | x86_64_mac | arm64_mac`

Required: No

**BlockDeviceMapping.N**

Any block device mapping entries for the instance.

Type: Array of InstanceBlockDeviceMapping objects

Required: No

**bootMode**

The boot mode that was specified by the AMI. If the value is `uefi-preferred`, the AMI supports both UEFI and Legacy BIOS. The `currentInstanceBootMode` parameter is the boot mode that is used to boot the instance at launch or start.

> **Note**
>
> The operating system contained in the AMI must be configured to support the specified boot mode.

For more information, see Boot modes in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `legacy-bios | uefi | uefi-preferred`

Required: No

**capacityBlockId**

The ID of the Capacity Block.

> **Note**
>
> For P5 instances, a Capacity Block ID refers to a group of instances. For Trn2u instances, a capacity block ID refers to an EC2 UltraServer.

Type: String

Required: No

**capacityReservationId**

The ID of the Capacity Reservation.

Type: String

Required: No

**capacityReservationSpecification**

Information about the Capacity Reservation targeting option.

Type: CapacityReservationSpecificationResponse object

Required: No

**clientToken**

The idempotency token you provided when you launched the instance, if applicable.

Type: String

Required: No

**cpuOptions**

The CPU options for the instance.

Type: CpuOptions object

Required: No

**currentInstanceBootMode**

The boot mode that is used to boot the instance at launch or start. For more information, see Boot modes in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `legacy-bios | uefi`

Required: No

**dnsName**

The public DNS name assigned to the instance. This name is not available until the instance enters the `running` state. This name is only available if you've enabled DNS hostnames for your VPC. The format of this name depends on the public hostname type.

Type: String

Required: No

**ebsOptimized**

Indicates whether the instance is optimized for Amazon EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS Optimized instance.

Type: Boolean

Required: No

**ElasticGpuAssociationSet.N**

Deprecated.

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Type: Array of ElasticGpuAssociation objects

Required: No

**ElasticInferenceAcceleratorAssociationSet.N**

Deprecated

> **Note**
>
> Amazon Elastic Inference is no longer available.

Type: Array of ElasticInferenceAcceleratorAssociation objects

Required: No

**enaSupport**

Specifies whether enhanced networking with ENA is enabled.

Type: Boolean

Required: No

**enclaveOptions**

Indicates whether the instance is enabled for AWS Nitro Enclaves.

Type: EnclaveOptions object

Required: No

**GroupSet.N**

The security groups for the instance.

Type: Array of GroupIdentifier objects

Required: No

**hibernationOptions**

Indicates whether the instance is enabled for hibernation.

Type: HibernationOptions object

Required: No

**hypervisor**

The hypervisor type of the instance. The value `xen` is used for both Xen and Nitro hypervisors.

Type: String

Valid Values: `ovm | xen`

Required: No

**iamInstanceProfile**

The IAM instance profile associated with the instance, if applicable.

Type: IamInstanceProfile object

Required: No

**imageId**

The ID of the AMI used to launch the instance.

Type: String

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**instanceLifecycle**

Indicates whether this is a Spot Instance or a Scheduled Instance.

Type: String

Valid Values: `spot | scheduled | capacity-block | interruptible-capacity-reservation`

Required: No

**instanceState**

The current state of the instance.

Type: InstanceState object

Required: No

**instanceType**

The instance type.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge | g4dn.xlarge | g4dn.2xlarge | g4dn.4xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.xlarge | g5.2xlarge | g5.4xlarge | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge |

Required: No

**ipAddress**

The public IPv4 address, or the Carrier IP address assigned to the instance, if applicable.

A Carrier IP address only applies to an instance launched in a subnet associated with a Wavelength Zone.

Type: String

Required: No

**ipv6Address**

The IPv6 address assigned to the instance.

Type: String

Required: No

**kernelId**

The kernel associated with this instance, if applicable.

Type: String

Required: No

**keyName**

The name of the key pair, if this instance was launched with an associated key pair.

Type: String

Required: No

**launchTime**

The time that the instance was last launched. To determine the time that instance was first launched, see the attachment time for the primary network interface.

Type: Timestamp

Required: No

**LicenseSet.N**

The license configurations for the instance.

Type: Array of LicenseConfiguration objects

Required: No

**maintenanceOptions**

Provides information on the recovery and maintenance options of your instance.

Type: InstanceMaintenanceOptions object

Required: No

**metadataOptions**

The metadata options for the instance.

Type: InstanceMetadataOptionsResponse object

Required: No

**monitoring**

The monitoring for the instance.

Type: Monitoring object

Required: No

**NetworkInterfaceSet.N**

The network interfaces for the instance.

Type: Array of InstanceNetworkInterface objects

Required: No

**networkPerformanceOptions**

Contains settings for the network performance options for your instance.

Type: InstanceNetworkPerformanceOptions object

Required: No

**operator**

The service provider that manages the instance.

Type: OperatorResponse object

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost.

Type: String

Required: No

**placement**

The location where the instance launched, if applicable.

Type: Placement object

Required: No

**platform**

The platform. This value is `windows` for Windows instances; otherwise, it is empty.

Type: String

Valid Values: `windows`

Required: No

**platformDetails**

The platform details value for the instance. For more information, see AMI billing information fields in the *Amazon EC2 User Guide*.

Type: String

Required: No

**privateDnsName**

[IPv4 only] The private DNS hostname name assigned to the instance. This DNS hostname can only be used inside the Amazon EC2 network. This name is not available until the instance enters the `running` state.

The Amazon-provided DNS server resolves Amazon-provided private DNS hostnames if you've enabled DNS resolution and DNS hostnames in your VPC. If you are not using the Amazon-provided DNS server in your VPC, your custom domain name servers must resolve the hostname as appropriate.

Type: String

Required: No

**privateDnsNameOptions**

The options for the instance hostname.

Type: PrivateDnsNameOptionsResponse object

Required: No

**privateIpAddress**

The private IPv4 address assigned to the instance.

Type: String

Required: No

**ProductCodes.N**

The product codes attached to this instance, if applicable.

Type: Array of ProductCode objects

Required: No

**ramdiskId**

The RAM disk associated with this instance, if applicable.

Type: String

Required: No

**reason**

The reason for the most recent state transition. This might be an empty string.

Type: String

Required: No

**rootDeviceName**

The device name of the root device volume (for example, `/dev/sda1`).

Type: String

Required: No

**rootDeviceType**

The root device type used by the AMI. The AMI can use an EBS volume or an instance store volume.

Type: String

Valid Values: `ebs | instance-store`

Required: No

**SecondaryInterfaceSet.N**

The secondary interfaces for the instance.

Type: Array of InstanceSecondaryInterface objects

Required: No

**sourceDestCheck**

Indicates whether source/destination checking is enabled.

Type: Boolean

Required: No

**spotInstanceRequestId**

If the request is a Spot Instance request, the ID of the request.

Type: String

Required: No

**sriovNetSupport**

Specifies whether enhanced networking with the Intel 82599 Virtual Function interface is enabled.

Type: String

Required: No

**stateReason**

The reason for the most recent state transition.

Type: StateReason object

Required: No

**subnetId**

The ID of the subnet in which the instance is running.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the instance.

Type: Array of Tag objects

Required: No

**tpmSupport**

If the instance is configured for NitroTPM support, the value is `v2.0`. For more information, see NitroTPM in the *Amazon EC2 User Guide*.

Type: String

Required: No

**usageOperation**

The usage operation value for the instance. For more information, see AMI billing information fields in the *Amazon EC2 User Guide*.

Type: String

Required: No

**usageOperationUpdateTime**

The time that the usage operation was last updated.

Type: Timestamp

Required: No

**virtualizationType**

The virtualization type of the instance.

Type: String

Valid Values: `hvm | paravirtual`

Required: No

**vpcId**

The ID of the VPC in which the instance is running.

Type: String

Required: No

# InstanceAttachmentEnaSrdSpecification

ENA Express uses AWS Scalable Reliable Datagram (SRD) technology to increase the maximum bandwidth used per stream and minimize tail latency of network traffic between EC2 instances. With ENA Express, you can communicate between two EC2 instances in the same subnet within the same account, or in different accounts. Both sending and receiving instances must have ENA Express enabled.

To improve the reliability of network packet delivery, ENA Express reorders network packets on the receiving end by default. However, some UDP-based applications are designed to handle network packets that are out of order to reduce the overhead for packet delivery at the network layer. When ENA Express is enabled, you can specify whether UDP network traffic uses it.

## Contents

**enaSrdEnabled**

Indicates whether ENA Express is enabled for the network interface.

Type: Boolean

Required: No

**enaSrdUdpSpecification**

Configures ENA Express for UDP network traffic.

Type: InstanceAttachmentEnaSrdUdpSpecification object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceAttachmentEnaSrdUdpSpecification

ENA Express is compatible with both TCP and UDP transport protocols. When it's enabled, TCP traffic automatically uses it. However, some UDP-based applications are designed to handle network packets that are out of order, without a need for retransmission, such as live video broadcasting or other near-real-time applications. For UDP traffic, you can specify whether to use ENA Express, based on your application environment needs.

## Contents

**enaSrdUdpEnabled**

Indicates whether UDP traffic to and from the instance uses ENA Express. To specify this setting, you must first enable ENA Express.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceBlockDeviceMapping

Describes a block device mapping.

## Contents

**deviceName**

The device name.

Type: String

Required: No

**ebs**

Parameters used to automatically set up EBS volumes when the instance is launched.

Type: EbsInstanceBlockDevice object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceBlockDeviceMappingSpecification

Describes a block device mapping entry.

## Contents

**DeviceName**

The device name. For available device names, see Device names for volumes.

Type: String

Required: No

**Ebs**

Parameters used to automatically set up EBS volumes when the instance is launched.

Type: EbsInstanceBlockDeviceSpecification object

Required: No

**NoDevice**

Suppresses the specified device included in the block device mapping.

Type: String

Required: No

**VirtualName**

The virtual device name.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceCapacity

Information about the number of instances that can be launched onto the Dedicated Host.

## Contents

**availableCapacity**

The number of instances that can be launched onto the Dedicated Host based on the host's available capacity.

Type: Integer

Required: No

**instanceType**

The instance type supported by the Dedicated Host.

Type: String

Required: No

**totalCapacity**

The total number of instances that can be launched onto the Dedicated Host if there are no instances running on it.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceConnectEndpointDnsNames

The DNS names of the endpoint.

## Contents

**dnsName**

The DNS name of the EC2 Instance Connect Endpoint.

Type: String

Required: No

**fipsDnsName**

The Federal Information Processing Standards (FIPS) compliant DNS name of the EC2 Instance Connect Endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceConnectEndpointPublicDnsNames

The public DNS names of the endpoint, including IPv4-only and dualstack DNS names.

## Contents

**dualstack**

The dualstack DNS name of the EC2 Instance Connect Endpoint. A dualstack DNS name supports connections from both IPv4 and IPv6 clients.

Type: InstanceConnectEndpointDnsNames object

Required: No

**ipv4**

The IPv4-only DNS name of the EC2 Instance Connect Endpoint.

Type: InstanceConnectEndpointDnsNames object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceCount

Describes a Reserved Instance listing state.

## Contents

**instanceCount**

The number of listed Reserved Instances in the state specified by the `state`.

Type: Integer

Required: No

**state**

The states of the listed Reserved Instances.

Type: String

Valid Values: `available | sold | cancelled | pending`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceCreditSpecification

Describes the credit option for CPU usage of a burstable performance instance.

## Contents

**cpuCredits**

The credit option for CPU usage of the instance.

Valid values: `standard` | `unlimited`

Type: String

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceCreditSpecificationRequest

Describes the credit option for CPU usage of a burstable performance instance.

## Contents

**InstanceId**

The ID of the instance.

Type: String

Required: Yes

**CpuCredits**

The credit option for CPU usage of the instance.

Valid values: `standard` | `unlimited`

T3 instances with `host` tenancy do not support the `unlimited` CPU credit option.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceEventWindow

The event window.

## Contents

**associationTarget**

One or more targets associated with the event window.

Type: InstanceEventWindowAssociationTarget object

Required: No

**cronExpression**

The cron expression defined for the event window.

Type: String

Required: No

**instanceEventWindowId**

The ID of the event window.

Type: String

Required: No

**name**

The name of the event window.

Type: String

Required: No

**state**

The current state of the event window.

Type: String

Valid Values: `creating | deleting | active | deleted`

Required: No

**TagSet.N**

The instance tags associated with the event window.

Type: Array of Tag objects

Required: No

**TimeRangeSet.N**

One or more time ranges defined for the event window.

Type: Array of InstanceEventWindowTimeRange objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceEventWindowAssociationRequest

One or more targets associated with the specified event window. Only one *type* of target (instance ID, instance tag, or Dedicated Host ID) can be associated with an event window.

## Contents

**DedicatedHostId.N**

The IDs of the Dedicated Hosts to associate with the event window.

Type: Array of strings

Required: No

**InstanceId.N**

The IDs of the instances to associate with the event window. If the instance is on a Dedicated Host, you can't specify the Instance ID parameter; you must use the Dedicated Host ID parameter.

Type: Array of strings

Required: No

**InstanceTag.N**

The instance tags to associate with the event window. Any instances associated with the tags will be associated with the event window.

Note that while you can't create tag keys beginning with `aws:`, you can specify existing AWS managed tag keys (with the `aws:` prefix) when specifying them as targets to associate with the event window.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceEventWindowAssociationTarget

One or more targets associated with the event window.

## Contents

**DedicatedHostIdSet.N**

The IDs of the Dedicated Hosts associated with the event window.

Type: Array of strings

Required: No

**InstanceIdSet.N**

The IDs of the instances associated with the event window.

Type: Array of strings

Required: No

**TagSet.N**

The instance tags associated with the event window. Any instances associated with the tags will be associated with the event window.

Note that while you can't create tag keys beginning with `aws:`, you can specify existing AWS managed tag keys (with the `aws:` prefix) when specifying them as targets to associate with the event window.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# InstanceEventWindowDisassociationRequest

The targets to disassociate from the specified event window.

## Contents

**DedicatedHostId.N**

The IDs of the Dedicated Hosts to disassociate from the event window.

Type: Array of strings

Required: No

**InstanceId.N**

The IDs of the instances to disassociate from the event window.

Type: Array of strings

Required: No

**InstanceTag.N**

The instance tags to disassociate from the event window. Any instances associated with the tags will be disassociated from the event window.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceEventWindowStateChange

The state of the event window.

## Contents

**instanceEventWindowId**

The ID of the event window.

Type: String

Required: No

**state**

The current state of the event window.

Type: String

Valid Values: `creating | deleting | active | deleted`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceEventWindowTimeRange

The start day and time and the end day and time of the time range, in UTC.

## Contents

**endHour**

The hour when the time range ends.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 23.

Required: No

**endWeekDay**

The day on which the time range ends.

Type: String

Valid Values: `sunday | monday | tuesday | wednesday | thursday | friday | saturday`

Required: No

**startHour**

The hour when the time range begins.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 23.

Required: No

**startWeekDay**

The day on which the time range begins.

Type: String

Valid Values: `sunday | monday | tuesday | wednesday | thursday | friday | saturday`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceEventWindowTimeRangeRequest

The start day and time and the end day and time of the time range, in UTC.

## Contents

**EndHour**

The hour when the time range ends.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 23.

Required: No

**EndWeekDay**

The day on which the time range ends.

Type: String

Valid Values: `sunday | monday | tuesday | wednesday | thursday | friday | saturday`

Required: No

**StartHour**

The hour when the time range begins.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 23.

Required: No

**StartWeekDay**

The day on which the time range begins.

Type: String

Valid Values: `sunday | monday | tuesday | wednesday | thursday | friday | saturday`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceExportDetails

Describes an instance to export.

## Contents

**instanceId**

The ID of the resource being exported.

Type: String

Required: No

**targetEnvironment**

The target virtualization environment.

Type: String

Valid Values: `citrix | vmware | microsoft`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceFamilyCreditSpecification

Describes the default credit option for CPU usage of a burstable performance instance family.

## Contents

**cpuCredits**

The default credit option for CPU usage of the instance family. Valid values are `standard` and `unlimited`.

Type: String

Required: No

**instanceFamily**

The instance family.

Type: String

Valid Values: `t2 | t3 | t3a | t4g`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceImageMetadata

Information about the instance and the AMI used to launch the instance.

## Contents

**availabilityZone**

The Availability Zone or Local Zone of the instance.

Type: String

Required: No

**imageMetadata**

Information about the AMI used to launch the instance.

Type: ImageMetadata object

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**instanceOwnerId**

The ID of the AWS account that owns the instance.

Type: String

Required: No

**instanceState**

The current state of the instance.

Type: InstanceState object

Required: No

**instanceType**

The instance type.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge | g4dn.xlarge | g4dn.2xlarge | g4dn.4xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.xlarge | g5.2xlarge | g5.4xlarge | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge | g5.48xlarge | g5g.xlarge | g5g.2xlarge | g5g.4xlarge | g5g.8xlarge |

Required: No

**launchTime**

The time the instance was launched.

Type: Timestamp

Required: No

**operator**

The entity that manages the instance.

Type: OperatorResponse object

Required: No

**TagSet.N**

Any tags assigned to the instance.

Type: Array of Tag objects

Required: No

**zoneId**

The ID of the Availability Zone or Local Zone of the instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceIpv4Prefix

Information about an IPv4 prefix.

## Contents

**ipv4Prefix**

One or more IPv4 prefixes assigned to the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceIpv6Address

Describes an IPv6 address.

## Contents

**Ipv6Address** (request), **ipv6Address** (response)

The IPv6 address.

Type: String

Required: No

**IsPrimaryIpv6** (request), **isPrimaryIpv6** (response)

Determines if an IPv6 address associated with a network interface is the primary IPv6 address. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. For more information, see RunInstances.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceIpv6AddressRequest

Describes an IPv6 address.

## Contents

### Ipv6Address

The IPv6 address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceIpv6Prefix

Information about an IPv6 prefix.

## Contents

### ipv6Prefix

One or more IPv6 prefixes assigned to the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceMaintenanceOptions

The maintenance options for the instance.

## Contents

**autoRecovery**

Provides information on the current automatic recovery behavior of your instance.

Type: String

Valid Values: `disabled | default`

Required: No

**rebootMigration**

Specifies whether to attempt reboot migration during a user-initiated reboot of an instance that has a scheduled `system-reboot` event:

- `default` - Amazon EC2 attempts to migrate the instance to new hardware (reboot migration). If successful, the `system-reboot` event is cleared. If unsuccessful, an in-place reboot occurs and the event remains scheduled.
- `disabled` - Amazon EC2 keeps the instance on the same hardware (in-place reboot). The `system-reboot` event remains scheduled.

This setting only applies to supported instances that have a scheduled reboot event. For more information, see Enable or disable reboot migration in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `disabled | default`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceMaintenanceOptionsRequest

The maintenance options for the instance.

## Contents

**AutoRecovery**

Disables the automatic recovery behavior of your instance or sets it to default. For more information, see Simplified automatic recovery.

Type: String

Valid Values: `disabled | default`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceMarketOptionsRequest

Describes the market (purchasing) option for the instances.

## Contents

**MarketType**

The market type.

Type: String

Valid Values: `spot | capacity-block | interruptible-capacity-reservation`

Required: No

**SpotOptions**

The options for Spot Instances.

Type: SpotMarketOptions object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceMetadataDefaultsResponse

The default instance metadata service (IMDS) settings that were set at the account level in the specified AWS
Region.

## Contents

**httpEndpoint**

Indicates whether the IMDS endpoint for an instance is enabled or disabled. When disabled, the instance metadata can't be accessed.

Type: String

Valid Values: `disabled | enabled`

Required: No

**httpPutResponseHopLimit**

The maximum number of hops that the metadata token can travel.

Type: Integer

Required: No

**httpTokens**

Indicates whether IMDSv2 is required.

- `optional` – IMDSv2 is optional, which means that you can use either IMDSv2 or IMDSv1.
- `required` – IMDSv2 is required, which means that IMDSv1 is disabled, and you must use IMDSv2.

Type: String

Valid Values: `optional | required`

Required: No

**httpTokensEnforced**

Indicates whether to enforce the requirement of IMDSv2 on an instance at the time of launch. When enforcement is enabled, the instance can't launch unless IMDSv2 (`HttpTokens`) is set to `required`.

Type: String

Valid Values: `disabled | enabled`

Required: No

**instanceMetadataTags**

Indicates whether access to instance tags from the instance metadata is enabled or disabled. For more information, see View tags for your EC2 instances using instance metadata in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `disabled | enabled`

Required: No

**managedBy**

The entity that manages the IMDS default settings. Possible values include:

- `account` - The IMDS default settings are managed by the account.
- `declarative-policy` - The IMDS default settings are managed by a declarative policy and can't be modified by the account.

Type: String

Valid Values: `account | declarative-policy`

Required: No

**managedExceptionMessage**

The customized exception message that is specified in the declarative policy.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceMetadataOptionsRequest

The metadata options for the instance.

## Contents

**HttpEndpoint**

Enables or disables the HTTP metadata endpoint on your instances.

If you specify a value of `disabled`, you cannot access your instance metadata.

Default: `enabled`

Type: String

Valid Values: `disabled | enabled`

Required: No

**HttpProtocolIpv6**

Enables or disables the IPv6 endpoint for the instance metadata service.

Default: `disabled`

Type: String

Valid Values: `disabled | enabled`

Required: No

**HttpPutResponseHopLimit**

The maximum number of hops that the metadata token can travel.

Possible values: Integers from 1 to 64

Type: Integer

Required: No

**HttpTokens**

Indicates whether IMDSv2 is required.

- `optional` - IMDSv2 is optional, which means that you can use either IMDSv2 or IMDSv1.
- `required` - IMDSv2 is required, which means that IMDSv1 is disabled, and you must use IMDSv2.

Default:

- If the value of `ImdsSupport` for the Amazon Machine Image (AMI) for your instance is `v2.0` and the account level default is set to `no-preference`, the default is `required`.
- If the value of `ImdsSupport` for the Amazon Machine Image (AMI) for your instance is `v2.0`, but the account level default is set to `V1 or V2`, the default is `optional`.

The default value can also be affected by other combinations of parameters. For more information, see Order of precedence for instance metadata options in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `optional | required`

Required: No

**InstanceMetadataTags**

Set to `enabled` to allow access to instance tags from the instance metadata. Set to `disabled` to turn off access to instance tags from the instance metadata. For more information, see View tags for your EC2 instances using instance metadata.

Default: `disabled`

Type: String

Valid Values: `disabled | enabled`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceMetadataOptionsResponse

The metadata options for the instance.

## Contents

**httpEndpoint**

Indicates whether the HTTP metadata endpoint on your instances is enabled or disabled.

If the value is `disabled`, you cannot access your instance metadata.

Type: String

Valid Values: `disabled | enabled`

Required: No

**httpProtocolIpv6**

Indicates whether the IPv6 endpoint for the instance metadata service is enabled or disabled.

Default: `disabled`

Type: String

Valid Values: `disabled | enabled`

Required: No

**httpPutResponseHopLimit**

The maximum number of hops that the metadata token can travel.

Possible values: Integers from 1 to 64

Type: Integer

Required: No

**httpTokens**

Indicates whether IMDSv2 is required.

- `optional` - IMDSv2 is optional, which means that you can use either IMDSv2 or IMDSv1.

- `required` - IMDSv2 is required, which means that IMDSv1 is disabled, and you must use IMDSv2.

Type: String

Valid Values: `optional | required`

Required: No

**instanceMetadataTags**

Indicates whether access to instance tags from the instance metadata is enabled or disabled. For more information, see View tags for your EC2 instances using instance metadata.

Type: String

Valid Values: `disabled | enabled`

Required: No

**state**

The state of the metadata option changes.

`pending` - The metadata options are being updated and the instance is not ready to process metadata traffic with the new selection.

`applied` - The metadata options have been successfully applied on the instance.

Type: String

Valid Values: `pending | applied`

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# InstanceMonitoring

Describes the monitoring of an instance.

## Contents

**instanceId**

The ID of the instance.

Type: String

Required: No

**monitoring**

The monitoring for the instance.

Type: Monitoring object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceNetworkInterface

Describes a network interface.

## Contents

**association**

The association information for an Elastic IPv4 associated with the network interface.

Type: InstanceNetworkInterfaceAssociation object

Required: No

**attachment**

The network interface attachment.

Type: InstanceNetworkInterfaceAttachment object

Required: No

**connectionTrackingConfiguration**

A security group connection tracking configuration that enables you to set the timeout for connection tracking on an Elastic network interface. For more information, see Connection tracking timeouts in the *Amazon EC2 User Guide*.

Type: ConnectionTrackingSpecificationResponse object

Required: No

**description**

The description.

Type: String

Required: No

**GroupSet.N**

The security groups.

Type: Array of GroupIdentifier objects

Required: No

**interfaceType**

The type of network interface.

Valid values: `interface` | `efa` | `efa-only` | `evs` | `trunk`

Type: String

Required: No

**Ipv4PrefixSet.N**

The IPv4 delegated prefixes that are assigned to the network interface.

Type: Array of InstanceIpv4Prefix objects

Required: No

**Ipv6AddressesSet.N**

The IPv6 addresses associated with the network interface.

Type: Array of InstanceIpv6Address objects

Required: No

**Ipv6PrefixSet.N**

The IPv6 delegated prefixes that are assigned to the network interface.

Type: Array of InstanceIpv6Prefix objects

Required: No

**macAddress**

The MAC address.

Type: String

Required: No

**networkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**operator**

The service provider that manages the network interface.

Type: OperatorResponse object

Required: No

**ownerId**

The ID of the AWS account that created the network interface.

Type: String

Required: No

**privateDnsName**

The private DNS name.

Type: String

Required: No

**privateIpAddress**

The IPv4 address of the network interface within the subnet.

Type: String

Required: No

**PrivateIpAddressesSet.N**

The private IPv4 addresses associated with the network interface.

Type: Array of InstancePrivateIpAddress objects

Required: No

**sourceDestCheck**

Indicates whether source/destination checking is enabled.

Type: Boolean

Required: No

**status**

The status of the network interface.

Type: String

Valid Values: `available | associated | attaching | in-use | detaching`

Required: No

**subnetId**

The ID of the subnet.

Type: String

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceNetworkInterfaceAssociation

Describes association information for an Elastic IP address (IPv4).

## Contents

**carrierIp**

The carrier IP address associated with the network interface.

Type: String

Required: No

**customerOwnedIp**

The customer-owned IP address associated with the network interface.

Type: String

Required: No

**ipOwnerId**

The ID of the owner of the Elastic IP address.

Type: String

Required: No

**publicDnsName**

The public DNS name.

Type: String

Required: No

**publicIp**

The public IP address or Elastic IP address bound to the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceNetworkInterfaceAttachment

Describes a network interface attachment.

## Contents

**attachmentId**

The ID of the network interface attachment.

Type: String

Required: No

**attachTime**

The time stamp when the attachment initiated.

Type: Timestamp

Required: No

**deleteOnTermination**

Indicates whether the network interface is deleted when the instance is terminated.

Type: Boolean

Required: No

**deviceIndex**

The index of the device on the instance for the network interface attachment.

Type: Integer

Required: No

**enaQueueCount**

The number of ENA queues created with the instance.

Type: Integer

Required: No

**enaSrdSpecification**

Contains the ENA Express settings for the network interface that's attached to the instance.

Type: InstanceAttachmentEnaSrdSpecification object

Required: No

**networkCardIndex**

The index of the network card.

Type: Integer

Required: No

**status**

The attachment state.

Type: String

Valid Values: `attaching | attached | detaching | detached`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceNetworkInterfaceSpecification

Describes a network interface.

## Contents

**AssociateCarrierIpAddress** (request), **AssociateCarrierIpAddress** (response)

Indicates whether to assign a carrier IP address to the network interface.

You can only assign a carrier IP address to a network interface that is in a subnet in a Wavelength Zone. For more information about carrier IP addresses, see Carrier IP address in the *AWS Wavelength Developer Guide*.

Type: Boolean

Required: No

**AssociatePublicIpAddress** (request), **associatePublicIpAddress** (response)

Indicates whether to assign a public IPv4 address to an instance you launch in a VPC. The public IP address can only be assigned to a network interface for eth0, and can only be assigned to a new network interface, not an existing one. You cannot specify more than one network interface in the request. If launching into a default subnet, the default value is `true`.

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the *Public IPv4 Address* tab on the Amazon VPC pricing page.

Type: Boolean

Required: No

**ConnectionTrackingSpecification** (request), **ConnectionTrackingSpecification** (response)

A security group connection tracking specification that enables you to set the timeout for connection tracking on an Elastic network interface. For more information, see Connection tracking timeouts in the *Amazon EC2 User Guide*.

Type: ConnectionTrackingSpecificationRequest object

Required: No

**DeleteOnTermination** (request), **deleteOnTermination** (response)

If set to `true`, the interface is deleted when the instance is terminated. You can specify `true` only if creating a new network interface when launching an instance.

Type: Boolean

Required: No

**Description** (request), **description** (response)

The description of the network interface. Applies only if creating a network interface when launching an instance.

Type: String

Required: No

**DeviceIndex** (request), **deviceIndex** (response)

The position of the network interface in the attachment order. A primary network interface has a device index of 0.

If you specify a network interface when launching an instance, you must specify the device index.

Type: Integer

Required: No

**EnaQueueCount** (request), **EnaQueueCount** (response)

The number of ENA queues to be created with the instance.

Type: Integer

Required: No

**EnaSrdSpecification** (request), **EnaSrdSpecification** (response)

Specifies the ENA Express settings for the network interface that's attached to the instance.

Type: EnaSrdSpecificationRequest object

Required: No

**InterfaceType** (request), **InterfaceType** (response)

The type of network interface.

If you specify `efa-only`, do not assign any IP addresses to the network interface. EFA-only network interfaces do not support IP addresses.

Valid values: `interface` | `efa` | `efa-only`

Type: String

Required: No

**Ipv4Prefix.N**

The IPv4 delegated prefixes to be assigned to the network interface. You cannot use this option if you use the `Ipv4PrefixCount` option.

Type: Array of Ipv4PrefixSpecificationRequest objects

Required: No

**Ipv4PrefixCount** (request), **Ipv4PrefixCount** (response)

The number of IPv4 delegated prefixes to be automatically assigned to the network interface. You cannot use this option if you use the `Ipv4Prefix` option.

Type: Integer

Required: No

**Ipv6AddressCount** (request), **ipv6AddressCount** (response)

A number of IPv6 addresses to assign to the network interface. Amazon EC2 chooses the IPv6 addresses from the range of the subnet. You cannot specify this option and the option to assign specific IPv6 addresses in the same request. You can specify this option if you've specified a minimum number of instances to launch.

Type: Integer

Required: No

**Ipv6Addresses.N**

The IPv6 addresses to assign to the network interface. You cannot specify this option and the option to assign a number of IPv6 addresses in the same request. You cannot specify this option if you've specified a minimum number of instances to launch.

Type: Array of InstanceIpv6Address objects

Required: No

**Ipv6Prefix.N**

The IPv6 delegated prefixes to be assigned to the network interface. You cannot use this option if you use the `Ipv6PrefixCount` option.

Type: Array of Ipv6PrefixSpecificationRequest objects

Required: No

**Ipv6PrefixCount** (request), **Ipv6PrefixCount** (response)

The number of IPv6 delegated prefixes to be automatically assigned to the network interface. You cannot use this option if you use the `Ipv6Prefix` option.

Type: Integer

Required: No

**NetworkCardIndex** (request), **NetworkCardIndex** (response)

The index of the network card. Some instance types support multiple network cards. The primary network interface must be assigned to network card index 0. The default is network card index 0.

If you are using RequestSpotInstances to create Spot Instances, omit this parameter because you can’t specify the network card index when using this API. To specify the network card index, use RunInstances.

Type: Integer

Required: No

**NetworkInterfaceId** (request), **networkInterfaceId** (response)

The ID of the network interface.

If you are creating a Spot Fleet, omit this parameter because you can't specify a network interface ID in a launch specification.

Type: String

Required: No

**PrimaryIpv6** (request), **PrimaryIpv6** (response)

The primary IPv6 address of the network interface. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. For more information about primary IPv6 addresses, see RunInstances.

Type: Boolean

Required: No

**PrivateIpAddress** (request), **privateIpAddress** (response)

The private IPv4 address of the network interface. Applies only if creating a network interface when launching an instance. You cannot specify this option if you're launching more than one instance in a RunInstances request.

Type: String

Required: No

**PrivateIpAddresses.N**

The private IPv4 addresses to assign to the network interface. Only one private IPv4 address can be designated as primary. You cannot specify this option if you're launching more than one instance in a RunInstances request.

Type: Array of PrivateIpAddressSpecification objects

Required: No

**SecondaryPrivateIpAddressCount** (request), **secondaryPrivateIpAddressCount** (response)

The number of secondary private IPv4 addresses. You can't specify this parameter and also specify a secondary private IP address using the `PrivateIpAddress` parameter.

Type: Integer

Required: No

**SecurityGroupId.N**

The IDs of the security groups for the network interface. Applies only if creating a network interface when launching an instance.

Type: Array of strings

Required: No

**SubnetId** (request), **subnetId** (response)

The ID of the subnet associated with the network interface. Applies only if creating a network interface when launching an instance.

Type: String

Required: No

## See Also

# InstanceNetworkPerformanceOptions

With network performance options, you can adjust your bandwidth preferences to meet the needs of the workload that runs on your instance.

## Contents

**bandwidthWeighting**

When you configure network bandwidth weighting, you can boost your baseline bandwidth for either networking or EBS by up to 25%. The total available baseline bandwidth for your instance remains the same. The default option uses the standard bandwidth configuration for your instance type.

Type: String

Valid Values: `default | vpc-1 | ebs-1`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceNetworkPerformanceOptionsRequest

Configure network performance options for your instance that are geared towards performance improvements based on the workload that it runs.

## Contents

**BandwidthWeighting**

Specify the bandwidth weighting option to boost the associated type of baseline bandwidth, as follows:

default

This option uses the standard bandwidth configuration for your instance type.

vpc-1

This option boosts your networking baseline bandwidth and reduces your EBS baseline bandwidth.

ebs-1

This option boosts your EBS baseline bandwidth and reduces your networking baseline bandwidth.

Type: String

Valid Values: `default | vpc-1 | ebs-1`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstancePrivateIpAddress

Describes a private IPv4 address.

## Contents

**association**

The association information for an Elastic IP address for the network interface.

Type: InstanceNetworkInterfaceAssociation object

Required: No

**primary**

Indicates whether this IPv4 address is the primary private IP address of the network interface.

Type: Boolean

Required: No

**privateDnsName**

The private IPv4 DNS name.

Type: String

Required: No

**privateIpAddress**

The private IPv4 address of the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceRequirements

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with these attributes.

You must specify `VCpuCount` and `MemoryMiB`. All other attributes are optional. Any unspecified optional attribute is set to its default.

When you specify multiple attributes, you get instance types that satisfy all of the specified attributes. If you specify multiple values for an attribute, you get instance types that satisfy any of the specified values.

To limit the list of instance types from which Amazon EC2 can identify matching instance types, you can use one of the following parameters, but not both in the same request:

- `AllowedInstanceTypes` - The instance types to include in the list. All other instance types are ignored, even if they match your specified attributes.
- `ExcludedInstanceTypes` - The instance types to exclude from the list, even if they match your specified attributes.

> **Note**
>
> If you specify `InstanceRequirements`, you can't specify `InstanceType`. Attribute-based instance type selection is only supported when using Auto Scaling groups, EC2 Fleet, and Spot Fleet to launch instances. If you plan to use the launch template in the launch instance wizard or with the RunInstances API, you can't specify `InstanceRequirements`.

For more information, see Create mixed instances group using attribute-based instance type selection in the *Amazon EC2 Auto Scaling User Guide*, and also Specify attributes for instance type selection for EC2 Fleet or Spot Fleet and Spot placement score in the *Amazon EC2 User Guide*.

## Contents

**AcceleratorCount** (request), **acceleratorCount** (response)

The minimum and maximum number of accelerators (GPUs, FPGAs, or AWS Inferentia chips) on an instance.

To exclude accelerator-enabled instance types, set `Max` to `0`.

Default: No minimum or maximum limits

Type: AcceleratorCount object

Required: No

**AcceleratorManufacturerSet.N**

Indicates whether instance types must have accelerators by specific manufacturers.

- For instance types with AWS devices, specify `amazon-web-services`.
- For instance types with AMD devices, specify `amd`.
- For instance types with Habana devices, specify `habana`.
- For instance types with NVIDIA devices, specify `nvidia`.
- For instance types with Xilinx devices, specify `xilinx`.

Default: Any manufacturer

Type: Array of strings

Valid Values: `amazon-web-services | amd | nvidia | xilinx | habana`

Required: No

**AcceleratorNameSet.N**

The accelerators that must be on the instance type.

- For instance types with NVIDIA A10G GPUs, specify `a10g`.
- For instance types with NVIDIA A100 GPUs, specify `a100`.
- For instance types with NVIDIA H100 GPUs, specify `h100`.
- For instance types with AWS Inferentia chips, specify `inferentia`.
- For instance types with AWS Inferentia2 chips, specify `inferentia2`.
- For instance types with Habana Gaudi HL-205 GPUs, specify `gaudi-hl-205`.
- For instance types with NVIDIA GRID K520 GPUs, specify `k520`.
- For instance types with NVIDIA K80 GPUs, specify `k80`.
- For instance types with NVIDIA L4 GPUs, specify `l4`.
- For instance types with NVIDIA L40S GPUs, specify `l40s`.

- For instance types with NVIDIA M60 GPUs, specify `m60`.
- For instance types with AMD Radeon Pro V520 GPUs, specify `radeon-pro-v520`.
- For instance types with AWS Trainium chips, specify `trainium`.
- For instance types with AWS Trainium2 chips, specify `trainium2`.
- For instance types with NVIDIA T4 GPUs, specify `t4`.
- For instance types with NVIDIA T4G GPUs, specify `t4g`.
- For instance types with Xilinx U30 cards, specify `u30`.
- For instance types with Xilinx VU9P FPGAs, specify `vu9p`.
- For instance types with NVIDIA V100 GPUs, specify `v100`.

Default: Any accelerator

Type: Array of strings

Valid Values: `a100 | inferentia | k520 | k80 | m60 | radeon-pro-v520 | t4 | vu9p | v100 | a10g | h100 | t4g | l40s | l4 | gaudi-hl-205 | inferentia2 | trainium | trainium2 | u30`

Required: No

**AcceleratorTotalMemoryMiB** (request), **acceleratorTotalMemoryMiB** (response)

The minimum and maximum amount of total accelerator memory, in MiB.

Default: No minimum or maximum limits

Type: AcceleratorTotalMemoryMiB object

Required: No

**AcceleratorTypeSet.N**

The accelerator types that must be on the instance type.

- For instance types with FPGA accelerators, specify `fpga`.
- For instance types with GPU accelerators, specify gpu.
- For instance types with Inference accelerators, specify `inference`.
- For instance types with Media accelerators, specify `media`.

Default: Any accelerator type

Type: Array of strings

Valid Values: `gpu | fpga | inference | media`

Required: No

**AllowedInstanceTypeSet.N**

The instance types to apply your specified attributes against. All other instance types are ignored, even if they match your specified attributes.

You can use strings with one or more wild cards, represented by an asterisk (*), to allow an instance type, size, or generation. The following are examples: `m5.8xlarge`, `c5*.*`, `m5a.*`, `r*`, `*3*`.

For example, if you specify `c5*`,Amazon EC2 will allow the entire C5 instance family, which includes all C5a and C5n instance types. If you specify `m5a.*`, Amazon EC2 will allow all the M5a instance types, but not the M5n instance types.

> **Note**
>
> If you specify `AllowedInstanceTypes`, you can't specify `ExcludedInstanceTypes`.

Default: All instance types

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 400 items.

Length Constraints: Minimum length of 1. Maximum length of 30.

Pattern: `[a-zA-Z0-9\.\*\-]+`

Required: No

**BareMetal** (request), **bareMetal** (response)

Indicates whether bare metal instance types must be included, excluded, or required.

- To include bare metal instance types, specify `included`.
- To require only bare metal instance types, specify `required`.

- To exclude bare metal instance types, specify `excluded`.

Default: `excluded`

Type: String

Valid Values: `included | required | excluded`

Required: No

**BaselineEbsBandwidthMbps** (request), **baselineEbsBandwidthMbps** (response)

The minimum and maximum baseline bandwidth to Amazon EBS, in Mbps. For more information, see Amazon EBS–optimized instances in the *Amazon EC2 User Guide*.

Default: No minimum or maximum limits

Type: BaselineEbsBandwidthMbps object

Required: No

**BaselinePerformanceFactors** (request), **baselinePerformanceFactors** (response)

The baseline performance to consider, using an instance family as a baseline reference. The instance family establishes the lowest acceptable level of performance. Amazon EC2 uses this baseline to guide instance type selection, but there is no guarantee that the selected instance types will always exceed the baseline for every application. Currently, this parameter only supports CPU performance as a baseline performance factor. For more information, see Performance protection in the *Amazon EC2 User Guide*.

Type: BaselinePerformanceFactors object

Required: No

**BurstablePerformance** (request), **burstablePerformance** (response)

Indicates whether burstable performance T instance types are included, excluded, or required. For more information, see Burstable performance instances.

- To include burstable performance instance types, specify `included`.
- To require only burstable performance instance types, specify `required`.
- To exclude burstable performance instance types, specify `excluded`.

Default: `excluded`

Type: String

Valid Values: `included | required | excluded`

Required: No

**CpuManufacturerSet.N**

The CPU manufacturers to include.

- For instance types with Intel CPUs, specify `intel`.
- For instance types with AMD CPUs, specify `amd`.
- For instance types with AWS CPUs, specify `amazon-web-services`.
- For instance types with Apple CPUs, specify `apple`.

> **Note**
>
> Don't confuse the CPU manufacturer with the CPU architecture. Instances will be launched with a compatible CPU architecture based on the Amazon Machine Image (AMI) that you specify in your launch template.

Default: Any manufacturer

Type: Array of strings

Valid Values: `intel | amd | amazon-web-services | apple`

Required: No

**ExcludedInstanceTypeSet.N**

The instance types to exclude.

You can use strings with one or more wild cards, represented by an asterisk (`*`), to exclude an instance type, size, or generation. The following are examples: `m5.8xlarge`, `c5*.*`, `m5a.*`, `r*`, `*3*`.

For example, if you specify `c5*`,Amazon EC2 will exclude the entire C5 instance family, which includes all C5a and C5n instance types. If you specify `m5a.*`, Amazon EC2 will exclude all the M5a instance types, but not the M5n instance types.

> **Note**
>
> If you specify `ExcludedInstanceTypes`, you can't specify `AllowedInstanceTypes`.

Default: No excluded instance types

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 400 items.

Length Constraints: Minimum length of 1. Maximum length of 30.

Pattern: `[a-zA-Z0-9\.\*\-]+`

Required: No

**InstanceGenerationSet.N**

Indicates whether current or previous generation instance types are included. The current generation instance types are recommended for use. Current generation instance types are typically the latest two to three generations in each instance family. For more information, see Instance types in the *Amazon EC2 User Guide*.

For current generation instance types, specify `current`.

For previous generation instance types, specify `previous`.

Default: Current and previous generation instance types

Type: Array of strings

Valid Values: `current | previous`

Required: No

**LocalStorage** (request), **localStorage** (response)

Indicates whether instance types with instance store volumes are included, excluded, or required. For more information, Amazon EC2 instance store in the *Amazon EC2 User Guide*.

- To include instance types with instance store volumes, specify `included`.
- To require only instance types with instance store volumes, specify `required`.
- To exclude instance types with instance store volumes, specify `excluded`.

Default: `included`

Type: String

Valid Values: `included | required | excluded`

Required: No

**LocalStorageTypeSet.N**

The type of local storage that is required.

- For instance types with hard disk drive (HDD) storage, specify hdd.
- For instance types with solid state drive (SSD) storage, specify `ssd`.

Default: hdd and `ssd`

Type: Array of strings

Valid Values: hdd | `ssd`

Required: No

**MaxSpotPriceAsPercentageOfOptimalOnDemandPrice** (request), **maxSpotPriceAsPercentageOfOptimalOnDemandPrice** (response)

[Price protection] The price protection threshold for Spot Instances, as a percentage of an identified On-Demand price. The identified On-Demand price is the price of the lowest priced current generation C, M, or R instance type with your specified attributes. If no current generation C, M, or R instance type matches your attributes, then the identified price is from the lowest priced current generation instance types, and failing that, from the lowest priced previous generation instance types that match your attributes. When Amazon EC2 selects instance types with your attributes, it will exclude instance types whose price exceeds your specified threshold.

The parameter accepts an integer, which Amazon EC2 interprets as a percentage.

If you set `TargetCapacityUnitType` to `vcpu` or `memory-mib`, the price protection threshold is based on the per vCPU or per memory price instead of the per instance price.

> **Note**
>
> Only one of `SpotMaxPricePercentageOverLowestPrice` or `MaxSpotPriceAsPercentageOfOptimalOnDemandPrice` can be specified. If you

don't specify either, Amazon EC2 will automatically apply optimal price protection to consistently select from a wide range of instance types. To indicate no price protection threshold for Spot Instances, meaning you want to consider all instance types that match your attributes, include one of these parameters and specify a high value, such as 999999.

Type: Integer

Required: No

**MemoryGiBPerVCpu** (request), **memoryGiBPerVCpu** (response)

The minimum and maximum amount of memory per vCPU, in GiB.

Default: No minimum or maximum limits

Type: MemoryGiBPerVCpu object

Required: No

**MemoryMiB** (request), **memoryMiB** (response)

The minimum and maximum amount of memory, in MiB.

Type: MemoryMiB object

Required: No

**NetworkBandwidthGbps** (request), **networkBandwidthGbps** (response)

The minimum and maximum amount of network bandwidth, in gigabits per second (Gbps).

Default: No minimum or maximum limits

Type: NetworkBandwidthGbps object

Required: No

**NetworkInterfaceCount** (request), **networkInterfaceCount** (response)

The minimum and maximum number of network interfaces.

Default: No minimum or maximum limits

Type: NetworkInterfaceCount object

Required: No

**OnDemandMaxPricePercentageOverLowestPrice** (request), **onDemandMaxPricePercentageOverLowestPrice** (response)

[Price protection] The price protection threshold for On-Demand Instances, as a percentage higher than an identified On-Demand price. The identified On-Demand price is the price of the lowest priced current generation C, M, or R instance type with your specified attributes. When Amazon EC2 selects instance types with your attributes, it will exclude instance types whose price exceeds your specified threshold.

The parameter accepts an integer, which Amazon EC2 interprets as a percentage.

To turn off price protection, specify a high value, such as 999999.

This parameter is not supported for GetSpotPlacementScores and GetInstanceTypesFromInstanceRequirements.

> **Note**
>
> If you set `TargetCapacityUnitType` to `vcpu` or `memory-mib`, the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Default: `20`

Type: Integer

Required: No

**RequireEncryptionInTransit** (request), **requireEncryptionInTransit** (response)

Specifies whether instance types must support encrypting in-transit traffic between instances. For more information, including the supported instance types, see Encryption in transit in the *Amazon EC2 User Guide*.

Default: `false`

Type: Boolean

Required: No

**RequireHibernateSupport** (request), **requireHibernateSupport** (response)

Indicates whether instance types must support hibernation for On-Demand Instances.

This parameter is not supported for GetSpotPlacementScores.

Default: `false`

Type: Boolean

Required: No

**SpotMaxPricePercentageOverLowestPrice** (request), **spotMaxPricePercentageOverLowestPrice** (response)

[Price protection] The price protection threshold for Spot Instances, as a percentage higher than an identified Spot price. The identified Spot price is the Spot price of the lowest priced current generation C, M, or R instance type with your specified attributes. If no current generation C, M, or R instance type matches your attributes, then the identified Spot price is from the lowest priced current generation instance types, and failing that, from the lowest priced previous generation instance types that match your attributes. When Amazon EC2 selects instance types with your attributes, it will exclude instance types whose Spot price exceeds your specified threshold.

The parameter accepts an integer, which Amazon EC2 interprets as a percentage.

If you set `TargetCapacityUnitType` to `vcpu` or `memory-mib`, the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

This parameter is not supported for GetSpotPlacementScores and GetInstanceTypesFromInstanceRequirements.

> **Note**
>
> Only one of `SpotMaxPricePercentageOverLowestPrice` or `MaxSpotPriceAsPercentageOfOptimalOnDemandPrice` can be specified. If you don't specify either, Amazon EC2 will automatically apply optimal price protection to consistently select from a wide range of instance types. To indicate no price protection threshold for Spot Instances, meaning you want to consider all instance types that match your attributes, include one of these parameters and specify a high value, such as `999999`.

Default: 100

Type: Integer

Required: No

**TotalLocalStorageGB** (request), **totalLocalStorageGB** (response)

The minimum and maximum amount of total local storage, in GB.

Default: No minimum or maximum limits

Type: TotalLocalStorageGB object

Required: No

**VCpuCount** (request), **vCpuCount** (response)

The minimum and maximum number of vCPUs.

Type: VCpuCountRange object

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceRequirementsRequest

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with these attributes.

You must specify `VCpuCount` and `MemoryMiB`. All other attributes are optional. Any unspecified optional attribute is set to its default.

When you specify multiple attributes, you get instance types that satisfy all of the specified attributes. If you specify multiple values for an attribute, you get instance types that satisfy any of the specified values.

To limit the list of instance types from which Amazon EC2 can identify matching instance types, you can use one of the following parameters, but not both in the same request:

- `AllowedInstanceTypes` - The instance types to include in the list. All other instance types are ignored, even if they match your specified attributes.
- `ExcludedInstanceTypes` - The instance types to exclude from the list, even if they match your specified attributes.

> **Note**
>
> If you specify `InstanceRequirements`, you can't specify `InstanceType`. Attribute-based instance type selection is only supported when using Auto Scaling groups, EC2 Fleet, and Spot Fleet to launch instances. If you plan to use the launch template in the launch instance wizard, or with the RunInstances API or AWS::EC2::Instance AWS CloudFormation resource, you can't specify `InstanceRequirements`.

For more information, see Specify attributes for instance type selection for EC2 Fleet or Spot Fleet and Spot placement score in the *Amazon EC2 User Guide*.

## Contents

### MemoryMiB

The minimum and maximum amount of memory, in MiB.

Type: MemoryMiBRequest object

Required: Yes

**VCpuCount**

The minimum and maximum number of vCPUs.

Type: VCpuCountRangeRequest object

Required: Yes

**AcceleratorCount**

The minimum and maximum number of accelerators (GPUs, FPGAs, or AWS Inferentia chips) on an instance.

To exclude accelerator-enabled instance types, set `Max` to `0`.

Default: No minimum or maximum limits

Type: AcceleratorCountRequest object

Required: No

**AcceleratorManufacturer.N**

Indicates whether instance types must have accelerators by specific manufacturers.

- For instance types with AWS devices, specify `amazon-web-services`.
- For instance types with AMD devices, specify `amd`.
- For instance types with Habana devices, specify `habana`.
- For instance types with NVIDIA devices, specify `nvidia`.
- For instance types with Xilinx devices, specify `xilinx`.

Default: Any manufacturer

Type: Array of strings

Valid Values: `amazon-web-services | amd | nvidia | xilinx | habana`

Required: No

**AcceleratorName.N**

The accelerators that must be on the instance type.

- For instance types with NVIDIA A10G GPUs, specify `a10g`.
- For instance types with NVIDIA A100 GPUs, specify `a100`.
- For instance types with NVIDIA H100 GPUs, specify `h100`.
- For instance types with AWS Inferentia chips, specify `inferentia`.
- For instance types with AWS Inferentia2 chips, specify `inferentia2`.
- For instance types with Habana Gaudi HL-205 GPUs, specify `gaudi-hl-205`.
- For instance types with NVIDIA GRID K520 GPUs, specify `k520`.
- For instance types with NVIDIA K80 GPUs, specify `k80`.
- For instance types with NVIDIA L4 GPUs, specify `l4`.
- For instance types with NVIDIA L40S GPUs, specify `l40s`.
- For instance types with NVIDIA M60 GPUs, specify `m60`.
- For instance types with AMD Radeon Pro V520 GPUs, specify `radeon-pro-v520`.
- For instance types with AWS Trainium chips, specify `trainium`.
- For instance types with AWS Trainium2 chips, specify `trainium2`.
- For instance types with NVIDIA T4 GPUs, specify `t4`.
- For instance types with NVIDIA T4G GPUs, specify `t4g`.
- For instance types with Xilinx U30 cards, specify `u30`.
- For instance types with Xilinx VU9P FPGAs, specify `vu9p`.
- For instance types with NVIDIA V100 GPUs, specify `v100`.

Default: Any accelerator

Type: Array of strings

Valid Values: `a100 | inferentia | k520 | k80 | m60 | radeon-pro-v520 | t4 | vu9p | v100 | a10g | h100 | t4g | l40s | l4 | gaudi-hl-205 | inferentia2 | trainium | trainium2 | u30`

Required: No

**AcceleratorTotalMemoryMiB**

The minimum and maximum amount of total accelerator memory, in MiB.

Default: No minimum or maximum limits

Type: AcceleratorTotalMemoryMiBRequest object

Required: No

**AcceleratorType.N**

The accelerator types that must be on the instance type.

- For instance types with FPGA accelerators, specify `fpga`.
- For instance types with GPU accelerators, specify `gpu`.
- For instance types with Inference accelerators, specify `inference`.
- For instance types with Media accelerators, specify `media`.

Default: Any accelerator type

Type: Array of strings

Valid Values: `gpu | fpga | inference | media`

Required: No

**AllowedInstanceType.N**

The instance types to apply your specified attributes against. All other instance types are ignored, even if they match your specified attributes.

You can use strings with one or more wild cards, represented by an asterisk (`*`), to allow an instance type, size, or generation. The following are examples: `m5.8xlarge`, `c5*.*`, `m5a.*`, `r*`, `*3*`.

For example, if you specify `c5*`,Amazon EC2 will allow the entire C5 instance family, which includes all C5a and C5n instance types. If you specify `m5a.*`, Amazon EC2 will allow all the M5a instance types, but not the M5n instance types.

> **Note**
>
> If you specify `AllowedInstanceTypes`, you can't specify `ExcludedInstanceTypes`.

Default: All instance types

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 400 items.

Length Constraints: Minimum length of 1. Maximum length of 30.

Pattern: `[a-zA-Z0-9\.\*\-]+`

Required: No

**BareMetal**

Indicates whether bare metal instance types must be included, excluded, or required.

- To include bare metal instance types, specify `included`.
- To require only bare metal instance types, specify `required`.
- To exclude bare metal instance types, specify `excluded`.

Default: `excluded`

Type: String

Valid Values: `included | required | excluded`

Required: No

**BaselineEbsBandwidthMbps**

The minimum and maximum baseline bandwidth to Amazon EBS, in Mbps. For more information, see Amazon EBS–optimized instances in the *Amazon EC2 User Guide*.

Default: No minimum or maximum limits

Type: BaselineEbsBandwidthMbpsRequest object

Required: No

**BaselinePerformanceFactors**

The baseline performance to consider, using an instance family as a baseline reference. The instance family establishes the lowest acceptable level of performance. Amazon EC2 uses this baseline to guide instance type selection, but there is no guarantee that the selected instance types will always exceed the baseline for every application. Currently, this parameter only supports CPU performance as a baseline performance factor. For more information, see Performance protection in the *Amazon EC2 User Guide*.

Type: BaselinePerformanceFactorsRequest object

Required: No

**BurstablePerformance**

Indicates whether burstable performance T instance types are included, excluded, or required. For more information, see Burstable performance instances.

- To include burstable performance instance types, specify `included`.
- To require only burstable performance instance types, specify `required`.
- To exclude burstable performance instance types, specify `excluded`.

Default: `excluded`

Type: String

Valid Values: `included | required | excluded`

Required: No

**CpuManufacturer.N**

The CPU manufacturers to include.

- For instance types with Intel CPUs, specify `intel`.
- For instance types with AMD CPUs, specify `amd`.
- For instance types with AWS CPUs, specify `amazon-web-services`.
- For instance types with Apple CPUs, specify `apple`.

> **Note**
>
> Don't confuse the CPU manufacturer with the CPU architecture. Instances will be launched with a compatible CPU architecture based on the Amazon Machine Image (AMI) that you specify in your launch template.

Default: Any manufacturer

Type: Array of strings

Valid Values: `intel | amd | amazon-web-services | apple`

Required: No

**ExcludedInstanceType.N**

The instance types to exclude.

You can use strings with one or more wild cards, represented by an asterisk (*), to exclude an instance family, type, size, or generation. The following are examples: `m5.8xlarge`, `c5*.*`, `m5a.*`, `r*`, `*3*`.

For example, if you specify `c5*`,Amazon EC2 will exclude the entire C5 instance family, which includes all C5a and C5n instance types. If you specify `m5a.*`, Amazon EC2 will exclude all the M5a instance types, but not the M5n instance types.

> **Note**
>
> If you specify `ExcludedInstanceTypes`, you can't specify `AllowedInstanceTypes`.

Default: No excluded instance types

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 400 items.

Length Constraints: Minimum length of 1. Maximum length of 30.

Pattern: `[a-zA-Z0-9\.\*\-]+`

Required: No

**InstanceGeneration.N**

Indicates whether current or previous generation instance types are included. The current generation instance types are recommended for use. Current generation instance types are typically the latest two to three generations in each instance family. For more information, see Instance types in the *Amazon EC2 User Guide*.

For current generation instance types, specify `current`.

For previous generation instance types, specify `previous`.

Default: Current and previous generation instance types

Type: Array of strings

Valid Values: `current | previous`

Required: No

**LocalStorage**

Indicates whether instance types with instance store volumes are included, excluded, or required. For more information, Amazon EC2 instance store in the *Amazon EC2 User Guide*.

- To include instance types with instance store volumes, specify `included`.
- To require only instance types with instance store volumes, specify `required`.
- To exclude instance types with instance store volumes, specify `excluded`.

Default: `included`

Type: String

Valid Values: `included | required | excluded`

Required: No

**LocalStorageType.N**

The type of local storage that is required.

- For instance types with hard disk drive (HDD) storage, specify hdd.
- For instance types with solid state drive (SSD) storage, specify `ssd`.

Default: hdd and `ssd`

Type: Array of strings

Valid Values: hdd | `ssd`

Required: No

**MaxSpotPriceAsPercentageOfOptimalOnDemandPrice**

[Price protection] The price protection threshold for Spot Instances, as a percentage of an identified On-Demand price. The identified On-Demand price is the price of the lowest priced current generation C, M, or R instance type with your specified attributes. If no current

generation C, M, or R instance type matches your attributes, then the identified price is from the lowest priced current generation instance types, and failing that, from the lowest priced previous generation instance types that match your attributes. When Amazon EC2 selects instance types with your attributes, it will exclude instance types whose price exceeds your specified threshold.

The parameter accepts an integer, which Amazon EC2 interprets as a percentage.

If you set `TargetCapacityUnitType` to `vcpu` or `memory-mib`, the price protection threshold is based on the per vCPU or per memory price instead of the per instance price.

> **Note**
>
> Only one of `SpotMaxPricePercentageOverLowestPrice` or `MaxSpotPriceAsPercentageOfOptimalOnDemandPrice` can be specified. If you don't specify either, Amazon EC2 will automatically apply optimal price protection to consistently select from a wide range of instance types. To indicate no price protection threshold for Spot Instances, meaning you want to consider all instance types that match your attributes, include one of these parameters and specify a high value, such as `999999`.

Type: Integer

Required: No

**MemoryGiBPerVCpu**

The minimum and maximum amount of memory per vCPU, in GiB.

Default: No minimum or maximum limits

Type: MemoryGiBPerVCpuRequest object

Required: No

**NetworkBandwidthGbps**

The minimum and maximum amount of baseline network bandwidth, in gigabits per second (Gbps). For more information, see Amazon EC2 instance network bandwidth in the *Amazon EC2 User Guide*.

Default: No minimum or maximum limits

Type: NetworkBandwidthGbpsRequest object

Required: No

**NetworkInterfaceCount**

The minimum and maximum number of network interfaces.

Default: No minimum or maximum limits

Type: NetworkInterfaceCountRequest object

Required: No

**OnDemandMaxPricePercentageOverLowestPrice**

[Price protection] The price protection threshold for On-Demand Instances, as a percentage higher than an identified On-Demand price. The identified On-Demand price is the price of the lowest priced current generation C, M, or R instance type with your specified attributes. When Amazon EC2 selects instance types with your attributes, it will exclude instance types whose price exceeds your specified threshold.

The parameter accepts an integer, which Amazon EC2 interprets as a percentage.

To indicate no price protection threshold, specify a high value, such as 999999.

This parameter is not supported for GetSpotPlacementScores and GetInstanceTypesFromInstanceRequirements.

> **Note**
>
> If you set `TargetCapacityUnitType` to `vcpu` or `memory-mib`, the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

Default: `20`

Type: Integer

Required: No

**RequireEncryptionInTransit**

Specifies whether instance types must support encrypting in-transit traffic between instances. For more information, including the supported instance types, see Encryption in transit in the *Amazon EC2 User Guide*.

Default: `false`

Type: Boolean

Required: No

**RequireHibernateSupport**

Indicates whether instance types must support hibernation for On-Demand Instances.

This parameter is not supported for GetSpotPlacementScores.

Default: `false`

Type: Boolean

Required: No

**SpotMaxPricePercentageOverLowestPrice**

[Price protection] The price protection threshold for Spot Instances, as a percentage higher than an identified Spot price. The identified Spot price is the Spot price of the lowest priced current generation C, M, or R instance type with your specified attributes. If no current generation C, M, or R instance type matches your attributes, then the identified Spot price is from the lowest priced current generation instance types, and failing that, from the lowest priced previous generation instance types that match your attributes. When Amazon EC2 selects instance types with your attributes, it will exclude instance types whose Spot price exceeds your specified threshold.

The parameter accepts an integer, which Amazon EC2 interprets as a percentage.

If you set `TargetCapacityUnitType` to `vcpu` or `memory-mib`, the price protection threshold is applied based on the per-vCPU or per-memory price instead of the per-instance price.

This parameter is not supported for GetSpotPlacementScores and GetInstanceTypesFromInstanceRequirements.

> **Note**
>
> Only one of `SpotMaxPricePercentageOverLowestPrice` or `MaxSpotPriceAsPercentageOfOptimalOnDemandPrice` can be specified. If you don't specify either, Amazon EC2 will automatically apply optimal price protection to consistently select from a wide range of instance types. To indicate no price protection threshold for Spot Instances, meaning you want to consider all instance types that match your attributes, include one of these parameters and specify a high value, such as `999999`.

Default: `100`

Type: Integer

Required: No

**TotalLocalStorageGB**

The minimum and maximum amount of total local storage, in GB.

Default: No minimum or maximum limits

Type: TotalLocalStorageGBRequest object

Required: No

# InstanceRequirementsWithMetadataRequest

The architecture type, virtualization type, and other attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with those attributes.

If you specify `InstanceRequirementsWithMetadataRequest`, you can't specify `InstanceTypes`.

## Contents

**ArchitectureType.N**

The architecture type.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 3 items.

Valid Values: `i386 | x86_64 | arm64 | x86_64_mac | arm64_mac`

Required: No

**InstanceRequirements**

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with those attributes.

Type: InstanceRequirementsRequest object

Required: No

**VirtualizationType.N**

The virtualization type.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 2 items.

Valid Values: `hvm | paravirtual`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceSecondaryInterface

Describes a secondary interface attached to an instance.

## Contents

**attachment**

The attachment information for the secondary interface.

Type: InstanceSecondaryInterfaceAttachment object

Required: No

**interfaceType**

The type of secondary interface.

Type: String

Valid Values: `secondary`

Required: No

**macAddress**

The MAC address of the secondary interface.

Type: String

Required: No

**ownerId**

The AWS account ID of the owner of the secondary interface.

Type: String

Required: No

**PrivateIpAddressSet.N**

The private IPv4 addresses associated with the secondary interface.

Type: Array of InstanceSecondaryInterfacePrivateIpAddress objects

Required: No

**secondaryInterfaceId**

The ID of the secondary interface.

Type: String

Required: No

**secondaryNetworkId**

The ID of the secondary network.

Type: String

Required: No

**secondarySubnetId**

The ID of the secondary subnet.

Type: String

Required: No

**sourceDestCheck**

Indicates whether source/destination checking is enabled.

Type: Boolean

Required: No

**status**

The status of the secondary interface.

Type: String

Valid Values: `available | in-use`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceSecondaryInterfaceAttachment

Describes the attachment of a secondary interface to an instance.

## Contents

**attachmentId**

The ID of the attachment.

Type: String

Required: No

**attachTime**

The timestamp when the attachment was created.

Type: Timestamp

Required: No

**deleteOnTermination**

Indicates whether the secondary interface is deleted when the instance is terminated.

The only supported value for this field is `true`.

Type: Boolean

Required: No

**deviceIndex**

The device index of the secondary interface.

Type: Integer

Required: No

**networkCardIndex**

The index of the network card.

Type: Integer

Required: No

**status**

The attachment state.

Type: String

Valid Values: `attaching | attached | detaching | detached`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceSecondaryInterfacePrivateIpAddress

Describes a private IPv4 address for a secondary interface.

## Contents

**privateIpAddress**

The private IPv4 address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceSecondaryInterfacePrivateIpAddressRequest

Describes a private IPv4 address for a secondary interface request.

## Contents

**PrivateIpAddress**

The private IPv4 address.

Type: String

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceSecondaryInterfaceSpecificationRequest

Describes a secondary interface specification for launching an instance.

## Contents

**DeleteOnTermination**

Indicates whether the secondary interface is deleted when the instance is terminated.

The only supported value for this field is `true`.

Type: Boolean

Required: No

**DeviceIndex**

The device index for the secondary interface attachment.

Type: Integer

Required: No

**InterfaceType**

The type of secondary interface.

Type: String

Valid Values: `secondary`

Required: No

**NetworkCardIndex**

The index of the network card. The network card must support secondary interfaces.

Type: Integer

Required: No

**PrivateIpAddress.N**

The private IPv4 addresses to assign to the secondary interface.

Type: Array of InstanceSecondaryInterfacePrivateIpAddressRequest objects

Required: No

**PrivateIpAddressCount**

The number of private IPv4 addresses to assign to the secondary interface.

Type: Integer

Required: No

**SecondarySubnetId**

The ID of the secondary subnet.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceSpecification

The instance details to specify which volumes should be snapshotted.

## Contents

**InstanceId**

The instance to specify which volumes should be snapshotted.

Type: String

Required: Yes

**ExcludeBootVolume**

Excludes the root volume from being snapshotted.

Type: Boolean

Required: No

**ExcludeDataVolumeId.N**

The IDs of the data (non-root) volumes to exclude from the multi-volume snapshot set. If you specify the ID of the root volume, the request fails. To exclude the root volume, use **ExcludeBootVolume**.

You can specify up to 40 volume IDs per request.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceState

Describes the current state of an instance.

## Contents

**code**

The state of the instance as a 16-bit unsigned integer.

The high byte is all of the bits between 2^8 and (2^16)-1, which equals decimal values between 256 and 65,535. These numerical values are used for internal purposes and should be ignored.

The low byte is all of the bits between 2^0 and (2^8)-1, which equals decimal values between 0 and 255.

The valid values for instance-state-code will all be in the range of the low byte and they are:

- `0` : `pending`
- `16` : `running`
- `32` : `shutting-down`
- `48` : `terminated`
- `64` : `stopping`
- `80` : `stopped`

You can ignore the high byte value by zeroing out all of the bits above 2^8 or 256 in decimal.

Type: Integer

Required: No

**name**

The current state of the instance.

Type: String

Valid Values: `pending | running | shutting-down | terminated | stopping | stopped`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceStateChange

Describes an instance state change.

## Contents

**currentState**

The current state of the instance.

Type: InstanceState object

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**previousState**

The previous state of the instance.

Type: InstanceState object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceStatus

Describes the status of an instance.

## Contents

**attachedEbsStatus**

Reports impaired functionality that stems from an attached Amazon EBS volume that is unreachable and unable to complete I/O operations.

Type: EbsStatusSummary object

Required: No

**availabilityZone**

The Availability Zone of the instance.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone of the instance.

Type: String

Required: No

**EventsSet.N**

Any scheduled events associated with the instance.

Type: Array of InstanceStatusEvent objects

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**instanceState**

The intended state of the instance. DescribeInstanceStatus requires that an instance be in the `running` state.

Type: InstanceState object

Required: No

**instanceStatus**

Reports impaired functionality that stems from issues internal to the instance, such as impaired reachability.

Type: InstanceStatusSummary object

Required: No

**operator**

The service provider that manages the instance.

Type: OperatorResponse object

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost.

Type: String

Required: No

**systemStatus**

Reports impaired functionality that stems from issues related to the systems that support an instance, such as hardware failures and network connectivity problems.

Type: InstanceStatusSummary object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceStatusDetails

Describes the instance status.

## Contents

**impairedSince**

The time when a status check failed. For an instance that was launched and impaired, this is the time when the instance was launched.

Type: Timestamp

Required: No

**name**

The type of instance status.

Type: String

Valid Values: `reachability`

Required: No

**status**

The status.

Type: String

Valid Values: `passed | failed | insufficient-data | initializing`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# InstanceStatusEvent

Describes a scheduled event for an instance.

## Contents

**code**

The event code.

Type: String

Valid Values: `instance-reboot | system-reboot | system-maintenance | instance-retirement | instance-stop`

Required: No

**description**

A description of the event.

After a scheduled event is completed, it can still be described for up to a week. If the event has been completed, this description starts with the following text: [Completed].

Type: String

Required: No

**instanceEventId**

The ID of the event.

Type: String

Required: No

**notAfter**

The latest scheduled end time for the event.

Type: Timestamp

Required: No

**notBefore**

The earliest scheduled start time for the event.

Type: Timestamp

Required: No

**notBeforeDeadline**

The deadline for starting the event.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceStatusSummary

Describes the status of an instance.

## Contents

**Details.N**

The system instance health or application instance health.

Type: Array of InstanceStatusDetails objects

Required: No

**status**

The status.

Type: String

Valid Values: `ok | impaired | insufficient-data | not-applicable | initializing`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceStorageInfo

Describes the instance store features that are supported by the instance type.

## Contents

**Disks.N**

Describes the disks that are available for the instance type.

Type: Array of DiskInfo objects

Required: No

**encryptionSupport**

Indicates whether data is encrypted at rest.

Type: String

Valid Values: `unsupported | required`

Required: No

**nvmeSupport**

Indicates whether non-volatile memory express (NVMe) is supported.

Type: String

Valid Values: `unsupported | supported | required`

Required: No

**totalSizeInGB**

The total size of the disks, in GB.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceTagNotificationAttribute

Describes the registered tag keys for the current Region.

## Contents

**includeAllTagsOfInstance**

Indicates wheter all tag keys in the current Region are registered to appear in scheduled event notifications. `true` indicates that all tag keys in the current Region are registered.

Type: Boolean

Required: No

**InstanceTagKeySet.N**

The registered tag keys.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

# InstanceTopology

Information about the instance topology.

## Contents

**availabilityZone**

The name of the Availability Zone or Local Zone that the instance is in.

Type: String

Required: No

**capacityBlockId**

The ID of the Capacity Block. This parameter is only supported for UltraServer instances and identifies instances within the UltraServer domain.

Type: String

Required: No

**groupName**

The name of the placement group that the instance is in.

Type: String

Required: No

**instanceId**

The instance ID.

Type: String

Required: No

**instanceType**

The instance type.

Type: String

Required: No

**NetworkNodeSet.N**

The network nodes. The nodes are hashed based on your account. Instances from different accounts running under the same server will return a different hashed list of strings.

The value is `null` or empty if:

- The instance type is not supported.
- The instance is in a state other than `running`.

Type: Array of strings

Required: No

**zoneId**

The ID of the Availability Zone or Local Zone that the instance is in.

Type: String

Required: No

## See Also

# InstanceTypeInfo

Describes the instance type.

## Contents

**autoRecoverySupported**

Indicates whether Amazon CloudWatch action based recovery is supported.

Type: Boolean

Required: No

**bareMetal**

Indicates whether the instance is a bare metal instance type.

Type: Boolean

Required: No

**burstablePerformanceSupported**

Indicates whether the instance type is a burstable performance T instance type. For more information, see Burstable performance instances.

Type: Boolean

Required: No

**currentGeneration**

Indicates whether the instance type is current generation.

Type: Boolean

Required: No

**dedicatedHostsSupported**

Indicates whether Dedicated Hosts are supported on the instance type.

Type: Boolean

Required: No

**ebsInfo**

Describes the Amazon EBS settings for the instance type.

Type: EbsInfo object

Required: No

**fpgaInfo**

Describes the FPGA accelerator settings for the instance type.

Type: FpgaInfo object

Required: No

**freeTierEligible**

Indicates whether the instance type is eligible for the free tier.

Type: Boolean

Required: No

**gpuInfo**

Describes the GPU accelerator settings for the instance type.

Type: GpuInfo object

Required: No

**hibernationSupported**

Indicates whether On-Demand hibernation is supported.

Type: Boolean

Required: No

**hypervisor**

The hypervisor for the instance type.

Type: String

Valid Values: `nitro | xen`

Required: No

**inferenceAcceleratorInfo**

Describes the Inference accelerator settings for the instance type.

Type: InferenceAcceleratorInfo object

Required: No

**instanceStorageInfo**

Describes the instance storage for the instance type.

Type: InstanceStorageInfo object

Required: No

**instanceStorageSupported**

Indicates whether instance storage is supported.

Type: Boolean

Required: No

**instanceType**

The instance type. For more information, see Instance types in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge`

```

Required: No

**mediaAcceleratorInfo**

Describes the media accelerator settings for the instance type.

Type: MediaAcceleratorInfo object

Required: No

**memoryInfo**

Describes the memory for the instance type.

Type: MemoryInfo object

Required: No

**networkInfo**

Describes the network settings for the instance type.

Type: NetworkInfo object

Required: No

**neuronInfo**

Describes the Neuron accelerator settings for the instance type.

Type: NeuronInfo object

Required: No

**nitroEnclavesSupport**

Indicates whether Nitro Enclaves is supported.

Type: String

Valid Values: `unsupported | supported`

Required: No

**nitroTpmInfo**

Describes the supported NitroTPM versions for the instance type.

Type: NitroTpmInfo object

Required: No

**nitroTpmSupport**

Indicates whether NitroTPM is supported.

Type: String

Valid Values: `unsupported | supported`

Required: No

**phcSupport**

Indicates whether a local Precision Time Protocol (PTP) hardware clock (PHC) is supported.

Type: String

Valid Values: `unsupported | supported`

Required: No

**placementGroupInfo**

Describes the placement group settings for the instance type.

Type: PlacementGroupInfo object

Required: No

**processorInfo**

Describes the processor.

Type: ProcessorInfo object

Required: No

**rebootMigrationSupport**

Indicates whether reboot migration during a user-initiated reboot is supported for instances that have a scheduled `system-reboot` event. For more information, see Enable or disable reboot migration in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `unsupported | supported`

Required: No

**SupportedBootModes.N**

The supported boot modes. For more information, see Boot modes in the *Amazon EC2 User Guide*.

Type: Array of strings

Valid Values: `legacy-bios | uefi`

Required: No

**supportedInRegion**

Indicates whether the instance type is supported in the current Region.

Type: Boolean

Required: No

**SupportedRootDeviceTypes.N**

The supported root device types.

Type: Array of strings

Valid Values: `ebs | instance-store`

Required: No

**SupportedUsageClasses.N**

Indicates whether the instance type is offered for spot, On-Demand, or Capacity Blocks.

Type: Array of strings

Valid Values: `spot | on-demand | capacity-block`

Required: No

**SupportedVirtualizationTypes.N**

The supported virtualization types.

Type: Array of strings

Valid Values: `hvm | paravirtual`

Required: No

**vCpuInfo**

Describes the vCPU configurations for the instance type.

Type: VCpuInfo object

Required: No

# InstanceTypeInfoFromInstanceRequirements

The list of instance types with the specified instance attributes.

## Contents

**instanceType**

The matching instance type.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

# InstanceTypeOffering

The instance types offered.

## Contents

### instanceType

The instance type. For more information, see Instance types in the *Amazon EC2 User Guide*.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge

Required: No

**location**

The identifier for the location. This depends on the location type. For example, if the location type is `region`, the location is the Region code (for example, `us-east-2`.)

Type: String

Required: No

**locationType**

The location type.

Type: String

Valid Values: `region | availability-zone | availability-zone-id | outpost`

Required: No

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InstanceUsage

Information about the Capacity Reservation usage.

## Contents

**accountId**

The ID of the AWS account that is making use of the Capacity Reservation.

Type: String

Required: No

**usedInstanceCount**

The number of instances the AWS account currently has in the Capacity Reservation.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IntegrateServices

Describes service integrations with VPC Flow logs.

## Contents

**AthenaIntegration.N**

Information about the integration with Amazon Athena.

Type: Array of AthenaIntegration objects

Array Members: Minimum number of 1 item. Maximum number of 10 items.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InternetGateway

Describes an internet gateway.

## Contents

**AttachmentSet.N**

Any VPCs attached to the internet gateway.

Type: Array of InternetGatewayAttachment objects

Required: No

**internetGatewayId**

The ID of the internet gateway.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the internet gateway.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the internet gateway.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InternetGatewayAttachment

Describes the attachment of a VPC to an internet gateway or an egress-only internet gateway.

## Contents

**state**

The current state of the attachment. For an internet gateway, the state is `available` when attached to a VPC; otherwise, this value is not returned.

Type: String

Valid Values: `attaching | attached | detaching | detached`

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InterruptibleCapacityAllocation

Represents the allocation of capacity from a source reservation to an interruptible reservation, tracking current and target instance counts for allocation management.

## Contents

**instanceCount**

The current number of instances allocated to the interruptible reservation.

Type: Integer

Required: No

**interruptibleCapacityReservationId**

The ID of the interruptible Capacity Reservation created from the allocation.

Type: String

Required: No

**interruptionType**

The type of interruption policy applied to the interruptible reservation.

Type: String

Valid Values: adhoc

Required: No

**status**

The current status of the allocation (updating during reclamation, active when complete).

Type: String

Valid Values: `pending | active | updating | canceling | canceled | failed`

Required: No

**targetInstanceCount**

After your modify request, the requested number of instances allocated to interruptible reservation.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# InterruptionInfo

Contains information about how and when instances in an interruptible reservation can be terminated when capacity is reclaimed.

## Contents

**interruptionType**

The interruption type that determines how instances are terminated when capacity is reclaimed.

Type: String

Valid Values: adhoc

Required: No

**sourceCapacityReservationId**

The ID of the source Capacity Reservation from which the interruptible reservation was created.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipam

IPAM is a VPC feature that you can use to automate your IP address management workflows including assigning, tracking, troubleshooting, and auditing IP addresses across AWS Regions and accounts throughout your AWS Organization. For more information, see What is IPAM? in the *Amazon VPC IPAM User Guide*.

## Contents

**defaultResourceDiscoveryAssociationId**

The IPAM's default resource discovery association ID.

Type: String

Required: No

**defaultResourceDiscoveryId**

The IPAM's default resource discovery ID.

Type: String

Required: No

**description**

The description for the IPAM.

Type: String

Required: No

**enablePrivateGua**

Enable this option to use your own GUA ranges as private IPv6 addresses. This option is disabled by default.

Type: Boolean

Required: No

**ipamArn**

The Amazon Resource Name (ARN) of the IPAM.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamId**

The ID of the IPAM.

Type: String

Required: No

**ipamRegion**

The AWS Region of the IPAM.

Type: String

Required: No

**meteredAccount**

A metered account is an AWS account that is charged for active IP addresses managed in IPAM. For more information, see Enable cost distribution in the *Amazon VPC IPAM User Guide*.

Possible values:

- `ipam-owner` (default): The AWS account which owns the IPAM is charged for all active IP addresses managed in IPAM.
- `resource-owner`: The AWS account that owns the IP address is charged for the active IP address.

Type: String

Valid Values: `ipam-owner | resource-owner`

Required: No

**OperatingRegionSet.N**

The operating Regions for an IPAM. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

For more information about operating Regions, see Create an IPAM in the *Amazon VPC IPAM User Guide*.

Type: Array of IpamOperatingRegion objects

Required: No

**ownerId**

The AWS account ID of the owner of the IPAM.

Type: String

Required: No

**privateDefaultScopeId**

The ID of the IPAM's default private scope.

Type: String

Required: No

**publicDefaultScopeId**

The ID of the IPAM's default public scope.

Type: String

Required: No

**resourceDiscoveryAssociationCount**

The IPAM's resource discovery association count.

Type: Integer

Required: No

**scopeCount**

The number of scopes in the IPAM. The scope quota is 5. For more information on quotas, see Quotas in IPAM in the *Amazon VPC IPAM User Guide*.

Type: Integer

Required: No

**state**

The state of the IPAM.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | modify-in-progress | modify-complete | modify-failed | delete-in-progress | delete-complete | delete-failed | isolate-in-progress | isolate-complete | restore-in-progress`

Required: No

**stateMessage**

The state message.

Type: String

Required: No

**TagSet.N**

The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of Tag objects

Required: No

**tier**

IPAM is offered in a Free Tier and an Advanced Tier. For more information about the features available in each tier and the costs associated with the tiers, see Amazon VPC pricing > IPAM tab.

Type: String

Valid Values: `free | advanced`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamAddressHistoryRecord

The historical record of a CIDR within an IPAM scope. For more information, see View the history of IP addresses in the *Amazon VPC IPAM User Guide*.

## Contents

**resourceCidr**

The CIDR of the resource.

Type: String

Required: No

**resourceComplianceStatus**

The compliance status of a resource. For more information on compliance statuses, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

Type: String

Valid Values: `compliant | noncompliant | unmanaged | ignored`

Required: No

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceName**

The name of the resource.

Type: String

Required: No

**resourceOverlapStatus**

The overlap status of an IPAM resource. The overlap status tells you if the CIDR for a resource overlaps with another CIDR in the scope. For more information on overlap statuses, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

Type: String

Valid Values: `overlapping | nonoverlapping | ignored`

Required: No

**resourceOwnerId**

The ID of the resource owner.

Type: String

Required: No

**resourceRegion**

The AWS Region of the resource.

Type: String

Required: No

**resourceType**

The type of the resource.

Type: String

Valid Values: `eip | vpc | subnet | network-interface | instance`

Required: No

**sampledEndTime**

Sampled end time of the resource-to-CIDR association within the IPAM scope. Changes are picked up in periodic snapshots, so the end time may have occurred before this specific time.

Type: Timestamp

Required: No

**sampledStartTime**

Sampled start time of the resource-to-CIDR association within the IPAM scope. Changes are picked up in periodic snapshots, so the start time may have occurred before this specific time.

Type: Timestamp

Required: No

**vpcId**

The VPC ID of the resource.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamCidrAuthorizationContext

A signed document that proves that you are authorized to bring the specified IP address range to Amazon using BYOIP.

## Contents

**Message**

The plain-text authorization message for the prefix and account.

Type: String

Required: No

**Signature**

The signed authorization message for the prefix and account.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamDiscoveredAccount

An IPAM discovered account. A discovered account is an AWS account that is monitored under a resource discovery. If you have integrated IPAM with AWS Organizations, all accounts in the organization are discovered accounts.

## Contents

**accountId**

The account ID.

Type: String

Required: No

**discoveryRegion**

The AWS Region that the account information is returned from. An account can be discovered in multiple regions and will have a separate discovered account for each Region.

Type: String

Required: No

**failureReason**

The resource discovery failure reason.

Type: IpamDiscoveryFailureReason object

Required: No

**lastAttemptedDiscoveryTime**

The last attempted resource discovery time.

Type: Timestamp

Required: No

**lastSuccessfulDiscoveryTime**

The last successful resource discovery time.

Type: Timestamp

Required: No

**organizationalUnitId**

The ID of an Organizational Unit in AWS Organizations.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamDiscoveredPublicAddress

A public IP Address discovered by IPAM.

## Contents

**address**

The IP address.

Type: String

Required: No

**addressAllocationId**

The allocation ID of the resource the IP address is assigned to.

Type: String

Required: No

**addressOwnerId**

The ID of the owner of the resource the IP address is assigned to.

Type: String

Required: No

**addressRegion**

The Region of the resource the IP address is assigned to.

Type: String

Required: No

**addressType**

The IP address type.

Type: String

Valid Values: `service-managed-ip | service-managed-byoip | amazon-owned-eip | amazon-owned-contig | byoip | ec2-public-ip | anycast-ip-list-ip`

Required: No

**associationStatus**

The association status.

Type: String

Valid Values: `associated | disassociated`

Required: No

**instanceId**

The instance ID of the instance the assigned IP address is assigned to.

Type: String

Required: No

**ipamResourceDiscoveryId**

The resource discovery ID.

Type: String

Required: No

**networkBorderGroup**

The Availability Zone (AZ) or Local Zone (LZ) network border group that the resource that the IP address is assigned to is in. Defaults to an AZ network border group. For more information on available Local Zones, see Local Zone availability in the *Amazon EC2 User Guide*.

Type: String

Required: No

**networkInterfaceDescription**

The description of the network interface that IP address is assigned to.

Type: String

Required: No

**networkInterfaceId**

The network interface ID of the resource with the assigned IP address.

Type: String

Required: No

**publicIpv4PoolId**

The ID of the public IPv4 pool that the resource with the assigned IP address is from.

Type: String

Required: No

**sampleTime**

The last successful resource discovery time.

Type: Timestamp

Required: No

**SecurityGroupSet.N**

Security groups associated with the resource that the IP address is assigned to.

Type: Array of IpamPublicAddressSecurityGroup objects

Required: No

**service**

The AWS service associated with the IP address.

Type: String

Valid Values: `nat-gateway | database-migration-service | redshift | elastic-container-service | relational-database-service | site-to-site-vpn | load-balancer | global-accelerator | cloudfront | other`

Required: No

**serviceResource**

The resource ARN or ID.

Type: String

Required: No

**subnetId**

The ID of the subnet that the resource with the assigned IP address is in.

Type: String

Required: No

**tags**

Tags associated with the IP address.

Type: IpamPublicAddressTags object

Required: No

**vpcId**

The ID of the VPC that the resource with the assigned IP address is in.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamDiscoveredResourceCidr

An IPAM discovered resource CIDR. A discovered resource is a resource CIDR monitored under a resource discovery. The following resources can be discovered: VPCs, Public IPv4 pools, VPC subnets, and Elastic IP addresses. The discovered resource CIDR is the IP address range in CIDR notation that is associated with the resource.

## Contents

**availabilityZoneId**

The Availability Zone ID.

Type: String

Required: No

**ipamResourceDiscoveryId**

The resource discovery ID.

Type: String

Required: No

**ipSource**

The source that allocated the IP address space. `byoip` or `amazon` indicates public IP address space allocated by Amazon or space that you have allocated with Bring your own IP (BYOIP). `none` indicates private space.

Type: String

Valid Values: `amazon | byoip | none`

Required: No

**ipUsage**

The percentage of IP address space in use. To convert the decimal to a percentage, multiply the decimal by 100. Note the following:

- For resources that are VPCs, this is the percentage of IP address space in the VPC that's taken up by subnet CIDRs.

- For resources that are subnets, if the subnet has an IPv4 CIDR provisioned to it, this is the percentage of IPv4 address space in the subnet that's in use. If the subnet has an IPv6 CIDR provisioned to it, the percentage of IPv6 address space in use is not represented. The percentage of IPv6 address space in use cannot currently be calculated.
- For resources that are public IPv4 pools, this is the percentage of IP address space in the pool that's been allocated to Elastic IP addresses (EIPs).

Type: Double

Required: No

**networkInterfaceAttachmentStatus**

For elastic network interfaces, this is the status of whether or not the elastic network interface is attached.

Type: String

Valid Values: `available | in-use`

Required: No

**resourceCidr**

The resource CIDR.

Type: String

Required: No

**resourceId**

The resource ID.

Type: String

Required: No

**resourceOwnerId**

The resource owner ID.

Type: String

Required: No

**resourceRegion**

The resource Region.

Type: String

Required: No

**ResourceTagSet.N**

The resource tags.

Type: Array of IpamResourceTag objects

Required: No

**resourceType**

The resource type.

Type: String

Valid Values: `vpc | subnet | eip | public-ipv4-pool | ipv6-pool | eni | anycast-ip-list`

Required: No

**sampleTime**

The last successful resource discovery time.

Type: Timestamp

Required: No

**subnetId**

The subnet ID.

Type: String

Required: No

**vpcId**

The VPC ID.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamDiscoveryFailureReason

The discovery failure reason.

## Contents

**code**

The discovery failure code.

- `assume-role-failure` - IPAM could not assume the AWS IAM service-linked role. This could be because of any of the following:
  - SLR has not been created yet and IPAM is still creating it.
  - You have opted-out of the IPAM home Region.
  - Account you are using as your IPAM account has been suspended.
- `throttling-failure` - IPAM account is already using the allotted transactions per second and IPAM is receiving a throttling error when assuming the AWS IAM SLR.
- `unauthorized-failure` - AWS account making the request is not authorized. For more information, see AuthFailure in the *Amazon Elastic Compute Cloud API Reference*.

Type: String

Valid Values: `assume-role-failure | throttling-failure | unauthorized-failure`

Required: No

**message**

The discovery failure message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamExternalResourceVerificationToken

A verification token is an AWS-generated random value that you can use to prove ownership of an external resource. For example, you can use a verification token to validate that you control a public IP address range when you bring an IP address range to AWS (BYOIP).

## Contents

**ipamArn**

ARN of the IPAM that created the token.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamExternalResourceVerificationTokenArn**

Token ARN.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamExternalResourceVerificationTokenId**

The ID of the token.

Type: String

Required: No

**ipamId**

The ID of the IPAM that created the token.

Type: String

Required: No

**ipamRegion**

Region of the IPAM that created the token.

Type: String

Required: No

**notAfter**

Token expiration.

Type: Timestamp

Required: No

**state**

Token state.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | delete-in-progress | delete-complete | delete-failed`

Required: No

**status**

Token status.

Type: String

Valid Values: `valid | expired`

Required: No

**TagSet.N**

Token tags.

Type: Array of Tag objects

Required: No

**tokenName**

Token name.

Type: String

Required: No

**tokenValue**

Token value.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamOperatingRegion

The operating Regions for an IPAM. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

For more information about operating Regions, see Create an IPAM in the *Amazon VPC IPAM User Guide*.

## Contents

**regionName**

The name of the operating Region.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamOrganizationalUnitExclusion

If your IPAM is integrated with AWS Organizations and you add an organizational unit (OU) exclusion, IPAM will not manage the IP addresses in accounts in that OU exclusion.

## Contents

**organizationsEntityPath**

An AWS Organizations entity path. For more information on the entity path, see Understand the AWS Organizations entity path in the *AWS Identity and Access Management User Guide*.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPolicy

Information about an IPAM policy.

An IPAM policy is a set of rules that define how public IPv4 addresses from IPAM pools are allocated to AWS resources. Each rule maps an AWS service to IPAM pools that the service will use to get IP addresses. A single policy can have multiple rules and be applied to multiple AWS Regions. If the IPAM pool run out of addresses then the services fallback to Amazon-provided IP addresses. A policy can be applied to an individual AWS account or an entity within AWS Organizations.

## Contents

**ipamId**

The ID of the IPAM this policy belongs to.

Type: String

Required: No

**ipamPolicyArn**

The Amazon Resource Name (ARN) of the IPAM policy.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamPolicyId**

The ID of the IPAM policy.

Type: String

Required: No

**ipamPolicyRegion**

The Region of the IPAM policy.

Type: String

Required: No

**ownerId**

The account ID that owns the IPAM policy.

Type: String

Required: No

**state**

The state of the IPAM policy.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | modify-in-progress | modify-complete | modify-failed | delete-in-progress | delete-complete | delete-failed | isolate-in-progress | isolate-complete | restore-in-progress`

Required: No

**stateMessage**

A message about the state of the IPAM policy.

Type: String

Required: No

**TagSet.N**

The tags assigned to the IPAM policy.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPolicyAllocationRule

Information about an IPAM policy allocation rule.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

## Contents

**sourceIpamPoolId**

The ID of the source IPAM pool for the allocation rule.

An IPAM pool is a collection of IP addresses in IPAM that can be allocated to AWS resources.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPolicyAllocationRuleRequest

Information about a requested IPAM policy allocation rule.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

## Contents

**SourceIpamPoolId**

The ID of the source IPAM pool for the requested allocation rule.

An IPAM pool is a collection of IP addresses in IPAM that can be allocated to AWS resources.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPolicyDocument

Information about an IPAM policy.

## Contents

**AllocationRuleSet.N**

The allocation rules in the IPAM policy document.

Allocation rules are optional configurations within an IPAM policy that map AWS resource types to specific IPAM pools. If no rules are defined, the resource types default to using Amazon-provided IP addresses.

Type: Array of IpamPolicyAllocationRule objects

Required: No

**ipamPolicyId**

The ID of the IPAM policy.

Type: String

Required: No

**locale**

The locale of the IPAM policy document.

Type: String

Required: No

**resourceType**

The resource type of the IPAM policy document.

The AWS service or resource type that can use IP addresses through IPAM policies. Supported services and resource types include:

- Elastic IP addresses

Type: String

Valid Values: `alb | eip | rds | rnat`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPolicyOrganizationTarget

The AWS Organizations target for an IPAM policy.

## Contents

**organizationTargetId**

The ID of the AWS Organizations target.

A target can be an individual AWS account or an entity within an AWS Organization to which an IPAM policy can be applied.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPool

In IPAM, a pool is a collection of contiguous IP addresses CIDRs. Pools enable you to organize your IP addresses according to your routing and security needs. For example, if you have separate routing and security needs for development and production applications, you can create a pool for each.

## Contents

**addressFamily**

The address family of the pool.

Type: String

Valid Values: `ipv4 | ipv6`

Required: No

**allocationDefaultNetmaskLength**

The default netmask length for allocations added to this pool. If, for example, the CIDR assigned to this pool is 10.0.0.0/8 and you enter 16 here, new allocations will default to 10.0.0.0/16.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

**allocationMaxNetmaskLength**

The maximum netmask length possible for CIDR allocations in this IPAM pool to be compliant. The maximum netmask length must be greater than the minimum netmask length. Possible netmask lengths for IPv4 addresses are 0 - 32. Possible netmask lengths for IPv6 addresses are 0 - 128.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

**allocationMinNetmaskLength**

The minimum netmask length required for CIDR allocations in this IPAM pool to be compliant. The minimum netmask length must be less than the maximum netmask length. Possible netmask lengths for IPv4 addresses are 0 - 32. Possible netmask lengths for IPv6 addresses are 0 - 128.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 128.

Required: No

**AllocationResourceTagSet.N**

Tags that are required for resources that use CIDRs from this IPAM pool. Resources that do not have these tags will not be allowed to allocate space from the pool. If the resources have their tags changed after they have allocated space or if the allocation tagging requirements are changed on the pool, the resource may be marked as noncompliant.

Type: Array of IpamResourceTag objects

Required: No

**autoImport**

If selected, IPAM will continuously look for resources within the CIDR range of this pool and automatically import them as allocations into your IPAM. The CIDRs that will be allocated for these resources must not already be allocated to other resources in order for the import to succeed. IPAM will import a CIDR regardless of its compliance with the pool's allocation rules, so a resource might be imported and subsequently marked as noncompliant. If IPAM discovers multiple CIDRs that overlap, IPAM will import the largest CIDR only. If IPAM discovers multiple CIDRs with matching CIDRs, IPAM will randomly import one of them only.

A locale must be set on the pool for this feature to work.

Type: Boolean

Required: No

**awsService**

Limits which service in AWS that the pool can be used in. "ec2", for example, allows users to use space for Elastic IP addresses and VPCs.

Type: String

Valid Values: `ec2 | global-services`

Required: No

**description**

The description of the IPAM pool.

Type: String

Required: No

**ipamArn**

The ARN of the IPAM.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamPoolArn**

The Amazon Resource Name (ARN) of the IPAM pool.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamPoolId**

The ID of the IPAM pool.

Type: String

Required: No

**ipamRegion**

The AWS Region of the IPAM pool.

Type: String

Required: No

**ipamScopeArn**

The ARN of the scope of the IPAM pool.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamScopeType**

In IPAM, a scope is the highest-level container within IPAM. An IPAM contains two default scopes. Each scope represents the IP space for a single network. The private scope is intended for all private IP address space. The public scope is intended for all public IP address space. Scopes enable you to reuse IP addresses across multiple unconnected networks without causing IP address overlap or conflict.

Type: String

Valid Values: `public | private`

Required: No

**locale**

The locale of the IPAM pool.

The locale for the pool should be one of the following:

- An AWS Region where you want this IPAM pool to be available for allocations.
- The network border group for an AWS Local Zone where you want this IPAM pool to be available for allocations (supported Local Zones). This option is only available for IPAM IPv4 pools in the public scope.

If you choose an AWS Region for locale that has not been configured as an operating Region for the IPAM, you'll get an error.

Type: String

Required: No

**ownerId**

The AWS account ID of the owner of the IPAM pool.

Type: String

Required: No

**poolDepth**

The depth of pools in your IPAM pool. The pool depth quota is 10. For more information, see Quotas in IPAM in the *Amazon VPC IPAM User Guide*.

Type: Integer

Required: No

**publicIpSource**

The IP address source for pools in the public scope. Only used for provisioning IP address CIDRs to pools in the public scope. Default is `BYOIP`. For more information, see Create IPv6 pools in the *Amazon VPC IPAM User Guide*. By default, you can add only one Amazon-provided IPv6 CIDR block to a top-level IPv6 pool. For information on increasing the default limit, see Quotas for your IPAM in the *Amazon VPC IPAM User Guide*.

Type: String

Valid Values: `amazon | byoip`

Required: No

**publiclyAdvertisable**

Determines if a pool is publicly advertisable. This option is not available for pools with AddressFamily set to `ipv4`.

Type: Boolean

Required: No

**sourceIpamPoolId**

The ID of the source IPAM pool. You can use this option to create an IPAM pool within an existing source pool.

Type: String

Required: No

**sourceResource**

The resource used to provision CIDRs to a resource planning pool.

Type: IpamPoolSourceResource object

Required: No

**state**

The state of the IPAM pool.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | modify-in-progress | modify-complete | modify-failed | delete-in-progress | delete-complete | delete-failed | isolate-in-progress | isolate-complete | restore-in-progress`

Required: No

**stateMessage**

The state message.

Type: String

Required: No

**TagSet.N**

The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of Tag objects

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPoolAllocation

In IPAM, an allocation is a CIDR assignment from an IPAM pool to another IPAM pool or to a resource.

## Contents

**cidr**

The CIDR for the allocation. A CIDR is a representation of an IP address and its associated network mask (or netmask) and refers to a range of IP addresses. An IPv4 CIDR example is `10.24.34.0/23`. An IPv6 CIDR example is `2001:DB8::/32`.

Type: String

Required: No

**description**

A description of the pool allocation.

Type: String

Required: No

**ipamPoolAllocationId**

The ID of an allocation.

Type: String

Required: No

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceOwner**

The owner of the resource.

Type: String

Required: No

**resourceRegion**

The AWS Region of the resource.

Type: String

Required: No

**resourceType**

The type of the resource.

Type: String

Valid Values: `ipam-pool | vpc | ec2-public-ipv4-pool | custom | subnet | eip | anycast-ip-list`

Required: No

**TagSet.N**

The tags for the IPAM pool allocation.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPoolCidr

A CIDR provisioned to an IPAM pool.

## Contents

**cidr**

The CIDR provisioned to the IPAM pool. A CIDR is a representation of an IP address and its associated network mask (or netmask) and refers to a range of IP addresses. An IPv4 CIDR example is `10.24.34.0/23`. An IPv6 CIDR example is `2001:DB8::/32`.

Type: String

Required: No

**failureReason**

Details related to why an IPAM pool CIDR failed to be provisioned.

Type: IpamPoolCidrFailureReason object

Required: No

**ipamPoolCidrId**

The IPAM pool CIDR ID.

Type: String

Required: No

**netmaskLength**

The netmask length of the CIDR you'd like to provision to a pool. Can be used for provisioning Amazon-provided IPv6 CIDRs to top-level pools and for provisioning CIDRs to pools with source pools. Cannot be used to provision BYOIP CIDRs to top-level pools. "NetmaskLength" or "Cidr" is required.

Type: Integer

Required: No

**state**

The state of the CIDR.

Type: String

Valid Values: `pending-provision | provisioned | failed-provision | pending-deprovision | deprovisioned | failed-deprovision | pending-import | failed-import`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPoolCidrFailureReason

Details related to why an IPAM pool CIDR failed to be provisioned.

## Contents

**code**

An error code related to why an IPAM pool CIDR failed to be provisioned.

Type: String

Valid Values: `cidr-not-available | limit-exceeded`

Required: No

**message**

A message related to why an IPAM pool CIDR failed to be provisioned.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPoolSourceResource

The resource used to provision CIDRs to a resource planning pool.

## Contents

**resourceId**

The source resource ID.

Type: String

Required: No

**resourceOwner**

The source resource owner.

Type: String

Required: No

**resourceRegion**

The source resource Region.

Type: String

Required: No

**resourceType**

The source resource type.

Type: String

Valid Values: vpc

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPoolSourceResourceRequest

The resource used to provision CIDRs to a resource planning pool.

## Contents

**ResourceId**

The source resource ID.

Type: String

Required: No

**ResourceOwner**

The source resource owner.

Type: String

Required: No

**ResourceRegion**

The source resource Region.

Type: String

Required: No

**ResourceType**

The source resource type.

Type: String

Valid Values: vpc

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPrefixListResolver

Describes an IPAM prefix list resolver.

An IPAM prefix list resolver is a component that manages the synchronization between IPAM's CIDR selection rules and customer-managed prefix lists. It automates connectivity configurations by selecting CIDRs from IPAM's database based on your business logic and synchronizing them with prefix lists used in resources such as VPC route tables and security groups.

## Contents

**addressFamily**

The address family (IPv4 or IPv6) for the IPAM prefix list resolver.

Type: String

Valid Values: `ipv4 | ipv6`

Required: No

**description**

The description of the IPAM prefix list resolver.

Type: String

Required: No

**ipamArn**

The Amazon Resource Name (ARN) of the IPAM associated with this resolver.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamPrefixListResolverArn**

The Amazon Resource Name (ARN) of the IPAM prefix list resolver.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamPrefixListResolverId**

The ID of the IPAM prefix list resolver.

Type: String

Required: No

**ipamRegion**

The AWS Region where the associated IPAM is located.

Type: String

Required: No

**lastVersionCreationStatus**

The status for the last time a version was created.

Each version is a snapshot of what CIDRs matched your rules at that moment in time. The version number increments every time the CIDR list changes due to infrastructure changes.

Type: String

Valid Values: `pending | success | failure`

Required: No

**lastVersionCreationStatusMessage**

The status message for the last time a version was created.

Each version is a snapshot of what CIDRs matched your rules at that moment in time. The version number increments every time the CIDR list changes due to infrastructure changes.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the IPAM prefix list resolver.

Type: String

Required: No

**state**

The current state of the IPAM prefix list resolver. Valid values include `create-in-progress`, `create-complete`, `create-failed`, `modify-in-progress`, `modify-complete`, `modify-failed`, `delete-in-progress`, `delete-complete`, and `delete-failed`.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | modify-in-progress | modify-complete | modify-failed | delete-in-progress | delete-complete | delete-failed | isolate-in-progress | isolate-complete | restore-in-progress`

Required: No

**TagSet.N**

The tags assigned to the IPAM prefix list resolver.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPrefixListResolverRule

Describes a CIDR selection rule.

CIDR selection rules define the business logic for selecting CIDRs from IPAM. If a CIDR matches any of the rules, it will be included. If a rule has multiple conditions, the CIDR has to match every condition of that rule. You can create a prefix list resolver without any CIDR selection rules, but it will generate empty versions (containing no CIDRs) until you add rules.

## Contents

**ConditionSet.N**

The conditions that determine which CIDRs are selected by this rule. Conditions specify criteria such as resource type, tags, account IDs, and Regions.

Type: Array of IpamPrefixListResolverRuleCondition objects

Required: No

**ipamScopeId**

The ID of the IPAM scope from which to select CIDRs. This determines whether to select from public or private IP address space.

Type: String

Required: No

**resourceType**

For rules of type `ipam-resource-cidr`, this is the resource type.

Type: String

Valid Values: `vpc | subnet | eip | public-ipv4-pool | ipv6-pool | eni | anycast-ip-list`

Required: No

**ruleType**

The type of CIDR selection rule. Valid values include `include` for selecting CIDRs that match the conditions, and `exclude` for excluding CIDRs that match the conditions.

Type: String

Valid Values: `static-cidr | ipam-resource-cidr | ipam-pool-cidr`

Required: No

**staticCidr**

A fixed list of CIDRs that do not change (like a manual list replicated across Regions).

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPrefixListResolverRuleCondition

Describes a condition within a CIDR selection rule. Conditions define the criteria for selecting CIDRs from IPAM's database based on resource attributes.

CIDR selection rules define the business logic for selecting CIDRs from IPAM. If a CIDR matches any of the rules, it will be included. If a rule has multiple conditions, the CIDR has to match every condition of that rule. You can create a prefix list resolver without any CIDR selection rules, but it will generate empty versions (containing no CIDRs) until you add rules.

There are three rule types. Only 2 of the 3 rule types support conditions - **IPAM pool CIDR** and **Scope resource CIDR**. **Static CIDR** rules cannot have conditions.

- **Static CIDR**: A fixed list of CIDRs that do not change (like a manual list replicated across Regions)
- **IPAM pool CIDR**: CIDRs from specific IPAM pools (like all CIDRs from your IPAM production pool)

  If you choose this option, choose the following:
  - **IPAM scope**: Select the IPAM scope to search for resources
  - **Conditions:**
    - **Property**
      - **IPAM pool ID**: Select an IPAM pool that contains the resources
      - **CIDR** (like 10.24.34.0/23)
    - **Operation**: Equals/Not equals
    - **Value**: The value on which to match the condition
- **Scope resource CIDR**: CIDRs from AWS resources like VPCs, subnets, EIPs within an IPAM scope

  If you choose this option, choose the following:
  - **IPAM scope**: Select the IPAM scope to search for resources
  - **Resource type**: Select a resource, like a VPC or subnet.
  - **Conditions**:
    - **Property**:
      - Resource ID: The unique ID of a resource (like vpc-1234567890abcdef0)
      - Resource owner (like 111122223333)
      - Resource region (like us-east-1)
      - Resource tag (like key: name, value: dev-vpc-1)

- CIDR (like 10.24.34.0/23)
- **Operation**: Equals/Not equals
- **Value**: The value on which to match the condition

## Contents

**cidr**

A CIDR block to match against. This condition selects CIDRs that fall within or match the specified CIDR range.

Type: String

Required: No

**ipamPoolId**

The ID of the IPAM pool to match against. This condition selects CIDRs that belong to the specified IPAM pool.

Type: String

Required: No

**operation**

The operation to perform when evaluating this condition. Valid values include `equals`, `not-equals`, `contains`, and `not-contains`.

Type: String

Valid Values: `equals | not-equals | subnet-of`

Required: No

**resourceId**

The ID of the AWS resource to match against. This condition selects CIDRs associated with the specified resource.

Type: String

Required: No

**resourceOwner**

The AWS account ID that owns the resources to match against. This condition selects CIDRs from resources owned by the specified account.

Type: String

Required: No

**resourceRegion**

The AWS Region where the resources are located. This condition selects CIDRs from resources in the specified Region.

Type: String

Required: No

**resourceTag**

A tag key-value pair to match against. This condition selects CIDRs from resources that have the specified tag.

Type: IpamResourceTag object

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPrefixListResolverRuleConditionRequest

Describes a condition used when creating or modifying resolver rules.

CIDR selection rules define the business logic for selecting CIDRs from IPAM. If a CIDR matches any of the rules, it will be included. If a rule has multiple conditions, the CIDR has to match every condition of that rule. You can create a prefix list resolver without any CIDR selection rules, but it will generate empty versions (containing no CIDRs) until you add rules.

There are three rule types. Only 2 of the 3 rule types support conditions - **IPAM pool CIDR** and **Scope resource CIDR**. **Static CIDR** rules cannot have conditions.

- **Static CIDR**: A fixed list of CIDRs that do not change (like a manual list replicated across Regions)
- **IPAM pool CIDR**: CIDRs from specific IPAM pools (like all CIDRs from your IPAM production pool)

  If you choose this option, choose the following:
  - **IPAM scope**: Select the IPAM scope to search for resources
  - **Conditions:**
    - **Property**
      - **IPAM pool ID**: Select an IPAM pool that contains the resources
      - **CIDR** (like 10.24.34.0/23)
    - **Operation**: Equals/Not equals
    - **Value**: The value on which to match the condition
- **Scope resource CIDR**: CIDRs from AWS resources like VPCs, subnets, EIPs within an IPAM scope

  If you choose this option, choose the following:
  - **IPAM scope**: Select the IPAM scope to search for resources
  - **Resource type**: Select a resource, like a VPC or subnet.
  - **Conditions**:
    - **Property**:
      - Resource ID: The unique ID of a resource (like vpc-1234567890abcdef0)
      - Resource owner (like 111122223333)
      - Resource region (like us-east-1)
      - Resource tag (like key: name, value: dev-vpc-1)
      - CIDR (like 10.24.34.0/23)

- **Operation**: Equals/Not equals
- **Value**: The value on which to match the condition

## Contents

**Operation**

The operation to perform when evaluating this condition.

Type: String

Valid Values: `equals | not-equals | subnet-of`

Required: Yes

**Cidr**

A CIDR block to match against. This condition selects CIDRs that fall within or match the specified CIDR range.

Type: String

Required: No

**IpamPoolId**

The ID of the IPAM pool to match against. This condition selects CIDRs that belong to the specified IPAM pool.

Type: String

Required: No

**ResourceId**

The ID of the AWS resource to match against. This condition selects CIDRs associated with the specified resource.

Type: String

Required: No

**ResourceOwner**

The AWS account ID that owns the resources to match against. This condition selects CIDRs from resources owned by the specified account.

Type: String

Required: No

**ResourceRegion**

The AWS Region where the resources are located. This condition selects CIDRs from resources in the specified Region.

Type: String

Required: No

**ResourceTag**

A tag key-value pair to match against. This condition selects CIDRs from resources that have the specified tag.

Type: RequestIpamResourceTag object

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPrefixListResolverRuleRequest

Describes a CIDR selection rule to include in a request. This is used when creating or modifying resolver rules.

CIDR selection rules define the business logic for selecting CIDRs from IPAM. If a CIDR matches any of the rules, it will be included. If a rule has multiple conditions, the CIDR has to match every condition of that rule. You can create a prefix list resolver without any CIDR selection rules, but it will generate empty versions (containing no CIDRs) until you add rules.

There are three rule types. Only 2 of the 3 rule types support conditions - **IPAM pool CIDR** and **Scope resource CIDR**. **Static CIDR** rules cannot have conditions.

- **Static CIDR**: A fixed list of CIDRs that do not change (like a manual list replicated across Regions)
- **IPAM pool CIDR**: CIDRs from specific IPAM pools (like all CIDRs from your IPAM production pool)

  If you choose this option, choose the following:
  - **IPAM scope**: Select the IPAM scope to search for resources
  - **Conditions:**
    - **Property**
      - **IPAM pool ID**: Select an IPAM pool that contains the resources
      - **CIDR** (like 10.24.34.0/23)
    - **Operation**: Equals/Not equals
    - **Value**: The value on which to match the condition
- **Scope resource CIDR**: CIDRs from AWS resources like VPCs, subnets, EIPs within an IPAM scope

  If you choose this option, choose the following:
  - **IPAM scope**: Select the IPAM scope to search for resources
  - **Resource type**: Select a resource, like a VPC or subnet.
  - **Conditions**:
    - **Property**:
      - Resource ID: The unique ID of a resource (like vpc-1234567890abcdef0)
      - Resource owner (like 111122223333)
      - Resource region (like us-east-1)
      - Resource tag (like key: name, value: dev-vpc-1)

- CIDR (like 10.24.34.0/23)
- **Operation**: Equals/Not equals
- **Value**: The value on which to match the condition

## Contents

**RuleType**

The type of CIDR selection rule. Valid values include `include` for selecting CIDRs that match the conditions, and `exclude` for excluding CIDRs that match the conditions.

Type: String

Valid Values: `static-cidr | ipam-resource-cidr | ipam-pool-cidr`

Required: Yes

**Condition.N**

The conditions that determine which CIDRs are selected by this rule. Conditions specify criteria such as resource type, tags, account IDs, and Regions.

Type: Array of IpamPrefixListResolverRuleConditionRequest objects

Required: No

**IpamScopeId**

The ID of the IPAM scope from which to select CIDRs. This determines whether to select from public or private IP address space.

Type: String

Required: No

**ResourceType**

For rules of type `ipam-resource-cidr`, this is the resource type.

Type: String

Valid Values: `vpc | subnet | eip | public-ipv4-pool | ipv6-pool | eni | anycast-ip-list`

Required: No

**StaticCidr**

A fixed list of CIDRs that do not change (like a manual list replicated across Regions).

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPrefixListResolverTarget

Describes an IPAM prefix list resolver target.

An IPAM prefix list resolver target is an association between a specific customer-managed prefix list and an IPAM prefix list resolver. The target enables the resolver to synchronize CIDRs selected by its rules into the specified prefix list, which can then be referenced in AWS resources.

## Contents

**desiredVersion**

The desired version of the prefix list that this target should synchronize with.

Type: Long

Required: No

**ipamPrefixListResolverId**

The ID of the IPAM prefix list resolver associated with this target.

Type: String

Required: No

**ipamPrefixListResolverTargetArn**

The Amazon Resource Name (ARN) of the IPAM prefix list resolver target.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamPrefixListResolverTargetId**

The ID of the IPAM prefix list resolver target.

Type: String

Required: No

**lastSyncedVersion**

The version of the prefix list that was last successfully synchronized by this target.

Type: Long

Required: No

**ownerId**

The ID of the AWS account that owns the IPAM prefix list resolver target.

Type: String

Required: No

**prefixListId**

The ID of the managed prefix list associated with this target.

Type: String

Required: No

**prefixListRegion**

The AWS Region where the prefix list associated with this target is located.

Type: String

Required: No

**state**

The current state of the IPAM prefix list resolver target. Valid values include `create-in-progress`, `create-complete`, `create-failed`, `modify-in-progress`, `modify-complete`, `modify-failed`, `delete-in-progress`, `delete-complete`, and `delete-failed`.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | modify-in-progress | modify-complete | modify-failed | sync-in-progress | sync-complete | sync-failed | delete-in-progress | delete-complete | delete-failed | isolate-in-progress | isolate-complete | restore-in-progress`

Required: No

**stateMessage**

A message describing the current state of the IPAM prefix list resolver target, including any error information.

Type: String

Required: No

**TagSet.N**

The tags assigned to the IPAM prefix list resolver target.

Type: Array of Tag objects

Required: No

**trackLatestVersion**

Indicates whether this target automatically tracks the latest version of the prefix list.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPrefixListResolverVersion

Describes a version of an IPAM prefix list resolver.

Each version is a snapshot of what CIDRs matched your rules at that moment in time. The version number increments every time the CIDR list changes due to infrastructure changes.

**Version example:**

**Initial State (Version 1)**

Production environment:

- vpc-prod-web (10.1.0.0/16) - tagged env=prod
- vpc-prod-db (10.2.0.0/16) - tagged env=prod

Resolver rule: Include all VPCs tagged env=prod

**Version 1 CIDRs:** 10.1.0.0/16, 10.2.0.0/16

**Infrastructure Change (Version 2)**

New VPC added:

- vpc-prod-api (10.3.0.0/16) - tagged env=prod

IPAM automatically detects the change and creates a new version.

**Version 2 CIDRs:** 10.1.0.0/16, 10.2.0.0/16, 10.3.0.0/16

## Contents

**version**

The version number of the IPAM prefix list resolver.

Each version is a snapshot of what CIDRs matched your rules at that moment in time. The version number increments every time the CIDR list changes due to infrastructure changes.

Type: Long

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPrefixListResolverVersionEntry

Describes a CIDR entry in a specific version of an IPAM prefix list resolver. This represents a CIDR that was selected and synchronized at a particular point in time.

## Contents

**cidr**

The CIDR block that was selected and synchronized in this resolver version.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPublicAddressSecurityGroup

The security group that the resource with the public IP address is in.

## Contents

**groupId**

The security group's ID.

Type: String

Required: No

**groupName**

The security group's name.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPublicAddressTag

A tag for a public IP address discovered by IPAM.

## Contents

**key**

The tag's key.

Type: String

Required: No

**value**

The tag's value.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamPublicAddressTags

Tags for a public IP address discovered by IPAM.

## Contents

**EipTagSet.N**

Tags for an Elastic IP address.

Type: Array of IpamPublicAddressTag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamResourceCidr

The CIDR for an IPAM resource.

## Contents

**availabilityZoneId**

The Availability Zone ID.

Type: String

Required: No

**complianceStatus**

The compliance status of the IPAM resource. For more information on compliance statuses, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

Type: String

Valid Values: `compliant | noncompliant | unmanaged | ignored`

Required: No

**ipamId**

The IPAM ID for an IPAM resource.

Type: String

Required: No

**ipamPoolId**

The pool ID for an IPAM resource.

Type: String

Required: No

**ipamScopeId**

The scope ID for an IPAM resource.

Type: String

Required: No

**ipUsage**

The percentage of IP address space in use. To convert the decimal to a percentage, multiply the decimal by 100. Note the following:

- For resources that are VPCs, this is the percentage of IP address space in the VPC that's taken up by subnet CIDRs.
- For resources that are subnets, if the subnet has an IPv4 CIDR provisioned to it, this is the percentage of IPv4 address space in the subnet that's in use. If the subnet has an IPv6 CIDR provisioned to it, the percentage of IPv6 address space in use is not represented. The percentage of IPv6 address space in use cannot currently be calculated.
- For resources that are public IPv4 pools, this is the percentage of IP address space in the pool that's been allocated to Elastic IP addresses (EIPs).

Type: Double

Required: No

**managementState**

The management state of the resource. For more information about management states, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

Type: String

Valid Values: `managed | unmanaged | ignored`

Required: No

**overlapStatus**

The overlap status of an IPAM resource. The overlap status tells you if the CIDR for a resource overlaps with another CIDR in the scope. For more information on overlap statuses, see Monitor CIDR usage by resource in the *Amazon VPC IPAM User Guide*.

Type: String

Valid Values: `overlapping | nonoverlapping | ignored`

Required: No

**resourceCidr**

The CIDR for an IPAM resource.

Type: String

Required: No

**resourceId**

The ID of an IPAM resource.

Type: String

Required: No

**resourceName**

The name of an IPAM resource.

Type: String

Required: No

**resourceOwnerId**

The AWS account number of the owner of an IPAM resource.

Type: String

Required: No

**resourceRegion**

The AWS Region for an IPAM resource.

Type: String

Required: No

**ResourceTagSet.N**

The tags for an IPAM resource.

Type: Array of IpamResourceTag objects

Required: No

**resourceType**

The type of IPAM resource.

Type: String

Valid Values: `vpc | subnet | eip | public-ipv4-pool | ipv6-pool | eni | anycast-ip-list`

Required: No

**vpcId**

The ID of a VPC.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamResourceDiscovery

A resource discovery is an IPAM component that enables IPAM to manage and monitor resources that belong to the owning account.

## Contents

**description**

The resource discovery description.

Type: String

Required: No

**ipamResourceDiscoveryArn**

The resource discovery Amazon Resource Name (ARN).

Type: String

Required: No

**ipamResourceDiscoveryId**

The resource discovery ID.

Type: String

Required: No

**ipamResourceDiscoveryRegion**

The resource discovery Region.

Type: String

Required: No

**isDefault**

Defines if the resource discovery is the default. The default resource discovery is the resource discovery automatically created when you create an IPAM.

Type: Boolean

Required: No

**OperatingRegionSet.N**

The operating Regions for the resource discovery. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

Type: Array of IpamOperatingRegion objects

Required: No

**OrganizationalUnitExclusionSet.N**

If your IPAM is integrated with AWS Organizations and you add an organizational unit (OU) exclusion, IPAM will not manage the IP addresses in accounts in that OU exclusion.

Type: Array of IpamOrganizationalUnitExclusion objects

Required: No

**ownerId**

The ID of the owner.

Type: String

Required: No

**state**

The lifecycle state of the resource discovery.

- `create-in-progress` - Resource discovery is being created.
- `create-complete` - Resource discovery creation is complete.
- `create-failed` - Resource discovery creation has failed.
- `modify-in-progress` - Resource discovery is being modified.
- `modify-complete` - Resource discovery modification is complete.
- `modify-failed` - Resource discovery modification has failed.
- `delete-in-progress` - Resource discovery is being deleted.
- `delete-complete` - Resource discovery deletion is complete.
- `delete-failed` - Resource discovery deletion has failed.

- `isolate-in-progress` - AWS account that created the resource discovery has been removed and the resource discovery is being isolated.
- `isolate-complete` - Resource discovery isolation is complete.
- `restore-in-progress` - AWS account that created the resource discovery and was isolated has been restored.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | modify-in-progress | modify-complete | modify-failed | delete-in-progress | delete-complete | delete-failed | isolate-in-progress | isolate-complete | restore-in-progress`

Required: No

**TagSet.N**

A tag is a label that you assign to an AWS resource. Each tag consists of a key and an optional value. You can use tags to search and filter your resources or track your AWS costs.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamResourceDiscoveryAssociation

An IPAM resource discovery association. An associated resource discovery is a resource discovery that has been associated with an IPAM. IPAM aggregates the resource CIDRs discovered by the associated resource discovery.

## Contents

**ipamArn**

The IPAM ARN.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamId**

The IPAM ID.

Type: String

Required: No

**ipamRegion**

The IPAM home Region.

Type: String

Required: No

**ipamResourceDiscoveryAssociationArn**

The resource discovery association Amazon Resource Name (ARN).

Type: String

Required: No

**ipamResourceDiscoveryAssociationId**

The resource discovery association ID.

Type: String

Required: No

**ipamResourceDiscoveryId**

The resource discovery ID.

Type: String

Required: No

**isDefault**

Defines if the resource discovery is the default. When you create an IPAM, a default resource discovery is created for your IPAM and it's associated with your IPAM.

Type: Boolean

Required: No

**ownerId**

The AWS account ID of the resource discovery owner.

Type: String

Required: No

**resourceDiscoveryStatus**

The resource discovery status.

- `active` - Connection or permissions required to read the results of the resource discovery are intact.
- `not-found` - Connection or permissions required to read the results of the resource discovery are broken. This may happen if the owner of the resource discovery stopped sharing it or deleted the resource discovery. Verify the resource discovery still exists and the AWS RAM resource share is still intact.

Type: String

Valid Values: `active | not-found`

Required: No

**state**

The lifecycle state of the association when you associate or disassociate a resource discovery.

- `associate-in-progress` - Resource discovery is being associated.
- `associate-complete` - Resource discovery association is complete.
- `associate-failed` - Resource discovery association has failed.
- `disassociate-in-progress` - Resource discovery is being disassociated.
- `disassociate-complete` - Resource discovery disassociation is complete.
- `disassociate-failed` - Resource discovery disassociation has failed.
- `isolate-in-progress` - AWS account that created the resource discovery association has been removed and the resource discovery association is being isolated.
- `isolate-complete` - Resource discovery isolation is complete.
- `restore-in-progress` - Resource discovery is being restored.

Type: String

Valid Values: `associate-in-progress | associate-complete | associate-failed | disassociate-in-progress | disassociate-complete | disassociate-failed | isolate-in-progress | isolate-complete | restore-in-progress`

Required: No

**TagSet.N**

A tag is a label that you assign to an AWS resource. Each tag consists of a key and an optional value. You can use tags to search and filter your resources or track your AWS costs.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# IpamResourceTag

The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

## Contents

**key**

The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: String

Required: No

**value**

The value of the tag.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamScope

In IPAM, a scope is the highest-level container within IPAM. An IPAM contains two default scopes. Each scope represents the IP space for a single network. The private scope is intended for all private IP address space. The public scope is intended for all public IP address space. Scopes enable you to reuse IP addresses across multiple unconnected networks without causing IP address overlap or conflict.

For more information, see How IPAM works in the *Amazon VPC IPAM User Guide*.

## Contents

**description**

The description of the scope.

Type: String

Required: No

**externalAuthorityConfiguration**

The external authority configuration for this IPAM scope, if configured.

The configuration that links an Amazon VPC IPAM scope to an external authority system. It specifies the type of external system and the external resource identifier that identifies your account or instance in that system.

In IPAM, an external authority is a third-party IP address management system that provides CIDR blocks when you provision address space for top-level IPAM pools. This allows you to use your existing IP management system to control which address ranges are allocated to AWS while using Amazon VPC IPAM to manage subnets within those ranges.

Type: IpamScopeExternalAuthorityConfiguration object

Required: No

**ipamArn**

The ARN of the IPAM.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamRegion**

The AWS Region of the IPAM scope.

Type: String

Required: No

**ipamScopeArn**

The Amazon Resource Name (ARN) of the scope.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ipamScopeId**

The ID of the scope.

Type: String

Required: No

**ipamScopeType**

The type of the scope.

Type: String

Valid Values: `public | private`

Required: No

**isDefault**

Defines if the scope is the default scope or not.

Type: Boolean

Required: No

**ownerId**

The AWS account ID of the owner of the scope.

Type: String

Required: No

**poolCount**

The number of pools in the scope.

Type: Integer

Required: No

**state**

The state of the IPAM scope.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | modify-in-progress | modify-complete | modify-failed | delete-in-progress | delete-complete | delete-failed | isolate-in-progress | isolate-complete | restore-in-progress`

Required: No

**TagSet.N**

The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpamScopeExternalAuthorityConfiguration

The configuration that links an Amazon VPC IPAM scope to an external authority system. It specifies the type of external system and the external resource identifier that identifies your account or instance in that system.

In IPAM, an external authority is a third-party IP address management system that provides CIDR blocks when you provision address space for top-level IPAM pools. This allows you to use your existing IP management system to control which address ranges are allocated to AWS while using Amazon VPC IPAM to manage subnets within those ranges.

## Contents

**externalResourceIdentifier**

The identifier for the external resource managing this scope. For Infoblox integrations, this is the Infoblox resource identifier in the format `<version>.identity.account.<entity_realm>.<entity_id>`.

Type: String

Required: No

**type**

The type of external authority managing this scope. Currently supports `Infoblox` for integration with Infoblox Universal DDI.

Type: String

Valid Values: `infoblox`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpPermission

Describes the permissions for a security group rule.

## Contents

**FromPort** (request), **fromPort** (response)

If the protocol is TCP or UDP, this is the start of the port range. If the protocol is ICMP or ICMPv6, this is the ICMP type or -1 (all ICMP types).

Type: Integer

Required: No

**Groups.N**

The security group and AWS account ID pairs.

Type: Array of UserIdGroupPair objects

Required: No

**IpProtocol** (request), **ipProtocol** (response)

The IP protocol name (`tcp`, `udp`, `icmp`, `icmpv6`) or number (see Protocol Numbers).

Use `-1` to specify all protocols. When authorizing security group rules, specifying `-1` or a protocol number other than `tcp`, `udp`, `icmp`, or `icmpv6` allows traffic on all ports, regardless of any port range you specify. For `tcp`, `udp`, and `icmp`, you must specify a port range. For `icmpv6`, the port range is optional; if you omit the port range, traffic for all types and codes is allowed.

Type: String

Required: No

**IpRanges.N**

The IPv4 address ranges.

Type: Array of IpRange objects

Required: No

**Ipv6Ranges.N**

The IPv6 address ranges.

Type: Array of Ipv6Range objects

Required: No

**PrefixListIds.N**

The prefix list IDs.

Type: Array of PrefixListId objects

Required: No

**ToPort** (request), **toPort** (response)

If the protocol is TCP or UDP, this is the end of the port range. If the protocol is ICMP or ICMPv6, this is the ICMP code or -1 (all ICMP codes). If the start port is -1 (all ICMP types), then the end port must be -1 (all ICMP codes).

Type: Integer

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# IpRange

Describes an IPv4 address range.

## Contents

**CidrIp** (request), **cidrIp** (response)

The IPv4 address range. You can either specify a CIDR block or a source security group, not both. To specify a single IPv4 address, use the /32 prefix length.

> **Note**
>
> AWS canonicalizes IPv4 and IPv6 CIDRs. For example, if you specify 100.68.0.18/18 for the CIDR block, AWS canonicalizes the CIDR block to 100.68.0.0/18. Any subsequent DescribeSecurityGroups and DescribeSecurityGroupRules calls will return the canonicalized form of the CIDR block. Additionally, if you attempt to add another rule with the non-canonical form of the CIDR (such as 100.68.0.18/18) and there is already a rule for the canonicalized form of the CIDR block (such as 100.68.0.0/18), the API throws an duplicate rule error.

Type: String

Required: No

**Description** (request), **description** (response)

A description for the security group rule that references this IPv4 address range.

Constraints: Up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and ._-:/()#,@[]+=&;{}!$*

Type: String

Required: No

## See Also

# Ipv4PrefixSpecification

Describes an IPv4 prefix.

## Contents

### ipv4Prefix

The IPv4 prefix. For information, see Assigning prefixes to network interfaces in the *Amazon EC2 User Guide*.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv4PrefixSpecificationRequest

Describes the IPv4 prefix option for a network interface.

## Contents

**Ipv4Prefix** (request), **Ipv4Prefix** (response)

The IPv4 prefix. For information, see Assigning prefixes to network interfaces in the *Amazon EC2 User Guide*.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv4PrefixSpecificationResponse

Information about the IPv4 delegated prefixes assigned to a network interface.

## Contents

**ipv4Prefix**

The IPv4 delegated prefixes assigned to the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv6CidrAssociation

Describes an IPv6 CIDR block association.

## Contents

**associatedResource**

The resource that's associated with the IPv6 CIDR block.

Type: String

Required: No

**ipv6Cidr**

The IPv6 CIDR block.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv6CidrBlock

Describes an IPv6 CIDR block.

## Contents

### ipv6CidrBlock

The IPv6 CIDR block.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv6Pool

Describes an IPv6 address pool.

## Contents

**description**

The description for the address pool.

Type: String

Required: No

**PoolCidrBlockSet.N**

The CIDR blocks for the address pool.

Type: Array of PoolCidrBlock objects

Required: No

**poolId**

The ID of the address pool.

Type: String

Required: No

**TagSet.N**

Any tags for the address pool.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv6PrefixSpecification

Describes the IPv6 prefix.

## Contents

### ipv6Prefix

The IPv6 prefix.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv6PrefixSpecificationRequest

Describes the IPv6 prefix option for a network interface.

## Contents

**Ipv6Prefix** (request), **Ipv6Prefix** (response)

The IPv6 prefix.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv6PrefixSpecificationResponse

Information about the IPv6 delegated prefixes assigned to a network interface.

## Contents

**ipv6Prefix**

The IPv6 delegated prefixes assigned to the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Ipv6Range

Describes an IPv6 address range.

## Contents

**CidrIpv6** (request), **cidrIpv6** (response)

The IPv6 address range. You can either specify a CIDR block or a source security group, not both. To specify a single IPv6 address, use the /128 prefix length.

> **Note**
>
> AWS canonicalizes IPv4 and IPv6 CIDRs. For example, if you specify 100.68.0.18/18 for the CIDR block, AWS canonicalizes the CIDR block to 100.68.0.0/18. Any subsequent DescribeSecurityGroups and DescribeSecurityGroupRules calls will return the canonicalized form of the CIDR block. Additionally, if you attempt to add another rule with the non-canonical form of the CIDR (such as 100.68.0.18/18) and there is already a rule for the canonicalized form of the CIDR block (such as 100.68.0.0/18), the API throws an duplicate rule error.

Type: String

Required: No

**Description** (request), **description** (response)

A description for the security group rule that references this IPv6 address range.

Constraints: Up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and ._-:/()#,@[]+=&;{}!$*

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# KeyPairInfo

Describes a key pair.

## Contents

**createTime**

If you used Amazon EC2 to create the key pair, this is the date and time when the key was created, in ISO 8601 date-time format, in the UTC time zone.

If you imported an existing key pair to Amazon EC2, this is the date and time the key was imported, in ISO 8601 date-time format, in the UTC time zone.

Type: Timestamp

Required: No

**keyFingerprint**

If you used CreateKeyPair to create the key pair:

- For RSA key pairs, the key fingerprint is the SHA-1 digest of the DER encoded private key.
- For ED25519 key pairs, the key fingerprint is the base64-encoded SHA-256 digest, which is the default for OpenSSH, starting with OpenSSH 6.8.

If you used ImportKeyPair to provide AWS the public key:

- For RSA key pairs, the key fingerprint is the MD5 public key fingerprint as specified in section 4 of RFC4716.
- For ED25519 key pairs, the key fingerprint is the base64-encoded SHA-256 digest, which is the default for OpenSSH, starting with OpenSSH 6.8.

Type: String

Required: No

**keyName**

The name of the key pair.

Type: String

Required: No

**keyPairId**

The ID of the key pair.

Type: String

Required: No

**keyType**

The type of key pair.

Type: String

Valid Values: `rsa | ed25519`

Required: No

**publicKey**

The public key material.

Type: String

Required: No

**TagSet.N**

Any tags applied to the key pair.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LastError

The last error that occurred for a VPC endpoint.

## Contents

**code**

The error code for the VPC endpoint error.

Type: String

Required: No

**message**

The error message for the VPC endpoint error.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchPermission

Describes a launch permission.

## Contents

**Group** (request), **group** (response)

The name of the group.

Type: String

Valid Values: `all`

Required: No

**OrganizationalUnitArn** (request), **organizationalUnitArn** (response)

The Amazon Resource Name (ARN) of an organizational unit (OU).

Type: String

Required: No

**OrganizationArn** (request), **organizationArn** (response)

The Amazon Resource Name (ARN) of an organization.

Type: String

Required: No

**UserId** (request), **userId** (response)

The AWS account ID.

Constraints: Up to 10 000 account IDs can be specified in a single request.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchPermissionModifications

Describes a launch permission modification.

## Contents

**Add.N**

The AWS account ID, organization ARN, or OU ARN to add to the list of launch permissions for the AMI.

Type: Array of LaunchPermission objects

Required: No

**Remove.N**

The AWS account ID, organization ARN, or OU ARN to remove from the list of launch permissions for the AMI.

Type: Array of LaunchPermission objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchSpecification

Describes the launch specification for an instance.

## Contents

**addressingType**

Deprecated.

Type: String

Required: No

**BlockDeviceMapping.N**

The block device mapping entries.

Type: Array of BlockDeviceMapping objects

Required: No

**ebsOptimized**

Indicates whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS Optimized instance.

Default: `false`

Type: Boolean

Required: No

**GroupSet.N**

The IDs of the security groups.

Type: Array of GroupIdentifier objects

Required: No

**iamInstanceProfile**

The IAM instance profile.

Type: IamInstanceProfileSpecification object

Required: No

**imageId**

The ID of the AMI.

Type: String

Required: No

**instanceType**

The instance type. Only one instance type can be specified.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge |

```

Required: No

**kernelId**

The ID of the kernel.

Type: String

Required: No

**keyName**

The name of the key pair.

Type: String

Required: No

**monitoring**

Describes the monitoring of an instance.

Type: RunInstancesMonitoringEnabled object

Required: No

**NetworkInterfaceSet.N**

The network interfaces. If you specify a network interface, you must specify subnet IDs and security group IDs using the network interface.

Type: Array of InstanceNetworkInterfaceSpecification objects

Required: No

**placement**

The placement information for the instance.

Type: SpotPlacement object

Required: No

**ramdiskId**

The ID of the RAM disk.

Type: String

Required: No

**subnetId**

The ID of the subnet in which to launch the instance.

Type: String

Required: No

**userData**

The base64-encoded user data that instances use when starting up. User data is limited to 16 KB.

Type: String

Required: No

## See Also

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplate

Describes a launch template.

## Contents

**createdBy**

The principal that created the launch template.

Type: String

Required: No

**createTime**

The time launch template was created.

Type: Timestamp

Required: No

**defaultVersionNumber**

The version number of the default version of the launch template.

Type: Long

Required: No

**latestVersionNumber**

The version number of the latest version of the launch template.

Type: Long

Required: No

**launchTemplateId**

The ID of the launch template.

Type: String

Required: No

**launchTemplateName**

The name of the launch template.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

**operator**

The entity that manages the launch template.

Type: OperatorResponse object

Required: No

**TagSet.N**

The tags for the launch template.

Type: Array of Tag objects

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateAndOverridesResponse

Describes a launch template and overrides.

## Contents

**launchTemplateSpecification**

The launch template.

Type: FleetLaunchTemplateSpecification object

Required: No

**overrides**

Any parameters that you specify override the same parameters in the launch template.

Type: FleetLaunchTemplateOverrides object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateBlockDeviceMapping

Describes a block device mapping.

## Contents

**deviceName**

The device name.

Type: String

Required: No

**ebs**

Information about the block device for an EBS volume.

Type: LaunchTemplateEbsBlockDevice object

Required: No

**noDevice**

To omit the device from the block device mapping, specify an empty string.

Type: String

Required: No

**virtualName**

The virtual device name (ephemeralN).

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateBlockDeviceMappingRequest

Describes a block device mapping.

## Contents

**DeviceName**

The device name (for example, /dev/sdh or xvdh).

Type: String

Required: No

**Ebs**

Parameters used to automatically set up EBS volumes when the instance is launched.

Type: LaunchTemplateEbsBlockDeviceRequest object

Required: No

**NoDevice**

To omit the device from the block device mapping, specify an empty string.

Type: String

Required: No

**VirtualName**

The virtual device name (ephemeralN). Instance store volumes are numbered starting from 0. An instance type with 2 available instance store volumes can specify mappings for ephemeral0 and ephemeral1. The number of available instance store volumes depends on the instance type. After you connect to the instance, you must mount the volume.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateCapacityReservationSpecificationRequest

Describes an instance's Capacity Reservation targeting option. You can specify only one option at a time. Use the `CapacityReservationPreference` parameter to configure the instance to run in On-Demand capacity or to run in any `open` Capacity Reservation that has matching attributes (instance type, platform, Availability Zone). Use the `CapacityReservationTarget` parameter to explicitly target a specific Capacity Reservation or a Capacity Reservation group.

## Contents

**CapacityReservationPreference**

Indicates the instance's Capacity Reservation preferences. Possible preferences include:

- `capacity-reservations-only` - The instance will only run in a Capacity Reservation or Capacity Reservation group. If capacity isn't available, the instance will fail to launch.
- `open` - The instance can run in any `open` Capacity Reservation that has matching attributes (instance type, platform, Availability Zone, tenancy).
- `none` - The instance avoids running in a Capacity Reservation even if one is available. The instance runs in On-Demand capacity.

Type: String

Valid Values: `capacity-reservations-only | open | none`

Required: No

**CapacityReservationTarget**

Information about the target Capacity Reservation or Capacity Reservation group.

Type: CapacityReservationTarget object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateCapacityReservationSpecificationResponse

Information about the Capacity Reservation targeting option.

## Contents

**capacityReservationPreference**

Indicates the instance's Capacity Reservation preferences. Possible preferences include:

- open - The instance can run in any open Capacity Reservation that has matching attributes (instance type, platform, Availability Zone).
- none - The instance avoids running in a Capacity Reservation even if one is available. The instance runs in On-Demand capacity.

Type: String

Valid Values: `capacity-reservations-only | open | none`

Required: No

**capacityReservationTarget**

Information about the target Capacity Reservation or Capacity Reservation group.

Type: CapacityReservationTargetResponse object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateConfig

Describes a launch template and overrides.

## Contents

**LaunchTemplateSpecification** (request), **launchTemplateSpecification** (response)

The launch template to use. Make sure that the launch template does not contain the `NetworkInterfaceId` parameter because you can't specify a network interface ID in a Spot Fleet.

Type: FleetLaunchTemplateSpecification object

Required: No

**Overrides.N**

Any parameters that you specify override the same parameters in the launch template.

Type: Array of LaunchTemplateOverrides objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateCpuOptions

The CPU options for the instance.

## Contents

**amdSevSnp**

Indicates whether the instance is enabled for AMD SEV-SNP. For more information, see AMD SEV-SNP for Amazon EC2 instances.

Type: String

Valid Values: `enabled | disabled`

Required: No

**coreCount**

The number of CPU cores for the instance.

Type: Integer

Required: No

**nestedVirtualization**

Indicates whether the instance is enabled for nested virtualization.

Type: String

Valid Values: `enabled | disabled`

Required: No

**threadsPerCore**

The number of threads per CPU core.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateCpuOptionsRequest

The CPU options for the instance. Both the core count and threads per core must be specified in the request.

## Contents

**AmdSevSnp**

Indicates whether to enable the instance for AMD SEV-SNP. AMD SEV-SNP is supported with M6a, R6a, and C6a instance types only. For more information, see AMD SEV-SNP for Amazon EC2 instances.

Type: String

Valid Values: `enabled | disabled`

Required: No

**CoreCount**

The number of CPU cores for the instance.

Type: Integer

Required: No

**NestedVirtualization**

Indicates whether to enable the instance for nested virtualization. Nested virtualization is supported only on 8th generation Intel-based instance types (c8i, m8i, r8i, and their flex variants). When nested virtualization is enabled, Virtual Secure Mode (VSM) is automatically disabled for the instance.

Type: String

Valid Values: `enabled | disabled`

Required: No

**ThreadsPerCore**

The number of threads per CPU core. To disable multithreading for the instance, specify a value of 1. Otherwise, specify the default value of 2.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateEbsBlockDevice

Describes a block device for an EBS volume.

## Contents

**deleteOnTermination**

Indicates whether the EBS volume is deleted on instance termination.

Type: Boolean

Required: No

**ebsCardIndex**

The index of the EBS card. Some instance types support multiple EBS cards. The default EBS card index is 0.

Type: Integer

Required: No

**encrypted**

Indicates whether the EBS volume is encrypted.

Type: Boolean

Required: No

**iops**

The number of I/O operations per second (IOPS) that the volume supports.

Type: Integer

Required: No

**kmsKeyId**

Identifier (key ID, key alias, key ARN, or alias ARN) of the customer managed KMS key to use for EBS encryption.

Type: String

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

**throughput**

The throughput that the volume supports, in MiB/s.

Type: Integer

Required: No

**volumeInitializationRate**

The Amazon EBS Provisioned Rate for Volume Initialization (volume initialization rate) specified for the volume, in MiB/s. If no volume initialization rate was specified, the value is `null`.

Type: Integer

Required: No

**volumeSize**

The size of the volume, in GiB.

Type: Integer

Required: No

**volumeType**

The volume type.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateEbsBlockDeviceRequest

The parameters for a block device for an EBS volume.

## Contents

**DeleteOnTermination**

Indicates whether the EBS volume is deleted on instance termination.

Type: Boolean

Required: No

**EbsCardIndex**

The index of the EBS card. Some instance types support multiple EBS cards. The default EBS card index is 0.

Type: Integer

Required: No

**Encrypted**

Indicates whether the EBS volume is encrypted. Encrypted volumes can only be attached to instances that support Amazon EBS encryption. If you are creating a volume from a snapshot, you can't specify an encryption value.

Type: Boolean

Required: No

**Iops**

The number of I/O operations per second (IOPS). For `gp3`, `io1`, and `io2` volumes, this represents the number of IOPS that are provisioned for the volume. For `gp2` volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting.

The following are the supported values for each volume type:

- `gp3`: 3,000 - 80,000 IOPS
- `io1`: 100 - 64,000 IOPS

- io2: 100 - 256,000 IOPS

  For io2 volumes, you can achieve up to 256,000 IOPS on instances built on the Nitro System. On other instances, you can achieve performance up to 32,000 IOPS.

  This parameter is supported for io1, io2, and gp3 volumes only.

  Type: Integer

  Required: No

**KmsKeyId**

Identifier (key ID, key alias, key ARN, or alias ARN) of the customer managed KMS key to use for EBS encryption.

Type: String

Required: No

**SnapshotId**

The ID of the snapshot.

Type: String

Required: No

**Throughput**

The throughput to provision for a gp3 volume, with a maximum of 2,000 MiB/s.

Valid Range: Minimum value of 125. Maximum value of 2,000.

Type: Integer

Required: No

**VolumeInitializationRate**

Specifies the Amazon EBS Provisioned Rate for Volume Initialization (volume initialization rate), in MiB/s, at which to download the snapshot blocks from Amazon S3 to the volume. This is also known as *volume initialization*. Specifying a volume initialization rate ensures that the volume is initialized at a predictable and consistent rate after creation.

This parameter is supported only for volumes created from snapshots. Omit this parameter if:

- You want to create the volume using fast snapshot restore. You must specify a snapshot that is enabled for fast snapshot restore. In this case, the volume is fully initialized at creation.

  > **Note**
  >
  > If you specify a snapshot that is enabled for fast snapshot restore and a volume initialization rate, the volume will be initialized at the specified rate instead of fast snapshot restore.

- You want to create a volume that is initialized at the default rate.

For more information, see Initialize Amazon EBS volumes in the *Amazon EC2 User Guide*.

Valid range: 100 - 300 MiB/s

Type: Integer

Required: No

**VolumeSize**

The size of the volume, in GiBs. You must specify either a snapshot ID or a volume size. The following are the supported volumes sizes for each volume type:

- `gp2`: 1 - 16,384 GiB
- `gp3`: 1 - 65,536 GiB
- `io1`: 4 - 16,384 GiB
- `io2`: 4 - 65,536 GiB
- `st1` and `sc1`: 125 - 16,384 GiB
- `standard`: 1 - 1024 GiB

Type: Integer

Required: No

**VolumeType**

The volume type. For more information, see Amazon EBS volume types in the *Amazon EBS User Guide*.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

# LaunchTemplateElasticInferenceAccelerator

> **Note**
>
> Amazon Elastic Inference is no longer available.

Describes an elastic inference accelerator.

## Contents

**Type**

The type of elastic inference accelerator. The possible values are eia1.medium, eia1.large, and eia1.xlarge.

Type: String

Required: Yes

**Count**

The number of elastic inference accelerators to attach to the instance.

Type: Integer

Valid Range: Minimum value of 1.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateElasticInferenceAcceleratorResponse

> **Note**
>
> Amazon Elastic Inference is no longer available.

Describes an elastic inference accelerator.

## Contents

**count**

The number of elastic inference accelerators to attach to the instance.

Type: Integer

Required: No

**type**

The type of elastic inference accelerator. The possible values are eia1.medium, eia1.large, and eia1.xlarge.

Type: String

Required: No

## See Also

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateEnaSrdSpecification

ENA Express uses AWS Scalable Reliable Datagram (SRD) technology to increase the maximum bandwidth used per stream and minimize tail latency of network traffic between EC2 instances. With ENA Express, you can communicate between two EC2 instances in the same subnet within the same account, or in different accounts. Both sending and receiving instances must have ENA Express enabled.

To improve the reliability of network packet delivery, ENA Express reorders network packets on the receiving end by default. However, some UDP-based applications are designed to handle network packets that are out of order to reduce the overhead for packet delivery at the network layer. When ENA Express is enabled, you can specify whether UDP network traffic uses it.

## Contents

**enaSrdEnabled**

Indicates whether ENA Express is enabled for the network interface.

Type: Boolean

Required: No

**enaSrdUdpSpecification**

Configures ENA Express for UDP network traffic.

Type: LaunchTemplateEnaSrdUdpSpecification object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateEnaSrdUdpSpecification

ENA Express is compatible with both TCP and UDP transport protocols. When it's enabled, TCP traffic automatically uses it. However, some UDP-based applications are designed to handle network packets that are out of order, without a need for retransmission, such as live video broadcasting or other near-real-time applications. For UDP traffic, you can specify whether to use ENA Express, based on your application environment needs.

## Contents

**enaSrdUdpEnabled**

Indicates whether UDP traffic to and from the instance uses ENA Express. To specify this setting, you must first enable ENA Express.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateEnclaveOptions

Indicates whether the instance is enabled for AWS Nitro Enclaves.

## Contents

**enabled**

If this parameter is set to `true`, the instance is enabled for AWS Nitro Enclaves; otherwise, it is not enabled for AWS Nitro Enclaves.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateEnclaveOptionsRequest

Indicates whether the instance is enabled for AWS Nitro Enclaves. For more information, see What is Nitro Enclaves? in the *AWS Nitro Enclaves User Guide*.

## Contents

### Enabled

To enable the instance for AWS Nitro Enclaves, set this parameter to `true`.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateHibernationOptions

Indicates whether an instance is configured for hibernation.

## Contents

**configured**

If this parameter is set to `true`, the instance is enabled for hibernation; otherwise, it is not enabled for hibernation.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateHibernationOptionsRequest

Indicates whether the instance is configured for hibernation. This parameter is valid only if the instance meets the hibernation prerequisites.

## Contents

### Configured

If you set this parameter to `true`, the instance is enabled for hibernation.

Default: `false`

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateIamInstanceProfileSpecification

Describes an IAM instance profile.

## Contents

**arn**

The Amazon Resource Name (ARN) of the instance profile.

Type: String

Required: No

**name**

The name of the instance profile.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateIamInstanceProfileSpecificationRequest

An IAM instance profile.

## Contents

**Arn**

The Amazon Resource Name (ARN) of the instance profile.

Type: String

Required: No

**Name**

The name of the instance profile.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

# LaunchTemplateInstanceMaintenanceOptions

The maintenance options of your instance.

## Contents

**autoRecovery**

Disables the automatic recovery behavior of your instance or sets it to default.

Type: String

Valid Values: `default | disabled`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateInstanceMaintenanceOptionsRequest

The maintenance options of your instance.

## Contents

**AutoRecovery**

Disables the automatic recovery behavior of your instance or sets it to default. For more information, see Simplified automatic recovery.

Type: String

Valid Values: `default | disabled`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateInstanceMarketOptions

The market (purchasing) option for the instances.

## Contents

**marketType**

The market type.

Type: String

Valid Values: `spot | capacity-block | interruptible-capacity-reservation`

Required: No

**spotOptions**

The options for Spot Instances.

Type: LaunchTemplateSpotMarketOptions object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateInstanceMarketOptionsRequest

The market (purchasing) option for the instances.

## Contents

**MarketType**

The market type.

Type: String

Valid Values: `spot | capacity-block | interruptible-capacity-reservation`

Required: No

**SpotOptions**

The options for Spot Instances.

Type: LaunchTemplateSpotMarketOptionsRequest object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateInstanceMetadataOptions

The metadata options for the instance. For more information, see Use instance metadata to manage your EC2 instance in the *Amazon EC2 User Guide*.

## Contents

**httpEndpoint**

Enables or disables the HTTP metadata endpoint on your instances. If the parameter is not specified, the default state is `enabled`.

> **Note**
>
> If you specify a value of `disabled`, you will not be able to access your instance metadata.

Type: String

Valid Values: `disabled | enabled`

Required: No

**httpProtocolIpv6**

Enables or disables the IPv6 endpoint for the instance metadata service.

Default: `disabled`

Type: String

Valid Values: `disabled | enabled`

Required: No

**httpPutResponseHopLimit**

The desired HTTP PUT response hop limit for instance metadata requests. The larger the number, the further instance metadata requests can travel.

Possible values: Integers from 1 to 64

Type: Integer

Required: No

**httpTokens**

Indicates whether IMDSv2 is required.

- `optional` - IMDSv2 is optional. You can choose whether to send a session token in your instance metadata retrieval requests. If you retrieve IAM role credentials without a session token, you receive the IMDSv1 role credentials. If you retrieve IAM role credentials using a valid session token, you receive the IMDSv2 role credentials.
- `required` - IMDSv2 is required. You must send a session token in your instance metadata retrieval requests. With this option, retrieving the IAM role credentials always returns IMDSv2 credentials; IMDSv1 credentials are not available.

Type: String

Valid Values: `optional | required`

Required: No

**instanceMetadataTags**

Set to `enabled` to allow access to instance tags from the instance metadata. Set to `disabled` to turn off access to instance tags from the instance metadata. For more information, see View tags for your EC2 instances using instance metadata.

Default: `disabled`

Type: String

Valid Values: `disabled | enabled`

Required: No

**state**

The state of the metadata option changes.

`pending` - The metadata options are being updated and the instance is not ready to process metadata traffic with the new selection.

`applied` - The metadata options have been successfully applied on the instance.

Type: String

Valid Values: `pending | applied`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateInstanceMetadataOptionsRequest

The metadata options for the instance. For more information, see Use instance metadata to manage your EC2 instance in the *Amazon EC2 User Guide*.

## Contents

**HttpEndpoint**

Enables or disables the HTTP metadata endpoint on your instances. If the parameter is not specified, the default state is `enabled`.

> **Note**
>
> If you specify a value of `disabled`, you will not be able to access your instance metadata.

Type: String

Valid Values: `disabled | enabled`

Required: No

**HttpProtocolIpv6**

Enables or disables the IPv6 endpoint for the instance metadata service.

Default: `disabled`

Type: String

Valid Values: `disabled | enabled`

Required: No

**HttpPutResponseHopLimit**

The desired HTTP PUT response hop limit for instance metadata requests. The larger the number, the further instance metadata requests can travel.

Default: 1

Possible values: Integers from 1 to 64

Type: Integer

Required: No

**HttpTokens**

Indicates whether IMDSv2 is required.

- `optional` - IMDSv2 is optional. You can choose whether to send a session token in your instance metadata retrieval requests. If you retrieve IAM role credentials without a session token, you receive the IMDSv1 role credentials. If you retrieve IAM role credentials using a valid session token, you receive the IMDSv2 role credentials.
- `required` - IMDSv2 is required. You must send a session token in your instance metadata retrieval requests. With this option, retrieving the IAM role credentials always returns IMDSv2 credentials; IMDSv1 credentials are not available.

Default: If the value of `ImdsSupport` for the Amazon Machine Image (AMI) for your instance is `v2.0`, the default is `required`.

Type: String

Valid Values: `optional | required`

Required: No

**InstanceMetadataTags**

Set to `enabled` to allow access to instance tags from the instance metadata. Set to `disabled` to turn off access to instance tags from the instance metadata. For more information, see View tags for your EC2 instances using instance metadata.

Default: `disabled`

Type: String

Valid Values: `disabled | enabled`

Required: No

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateInstanceNetworkInterfaceSpecification

Describes a network interface.

## Contents

**associateCarrierIpAddress**

Indicates whether to associate a Carrier IP address with eth0 for a new network interface.

Use this option when you launch an instance in a Wavelength Zone and want to associate a Carrier IP address with the network interface. For more information about Carrier IP addresses, see Carrier IP address in the *AWS Wavelength Developer Guide*.

Type: Boolean

Required: No

**associatePublicIpAddress**

Indicates whether to associate a public IPv4 address with eth0 for a new network interface.

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the *Public IPv4 Address* tab on the Amazon VPC pricing page.

Type: Boolean

Required: No

**connectionTrackingSpecification**

A security group connection tracking specification that enables you to set the timeout for connection tracking on an Elastic network interface. For more information, see Idle connection tracking timeout in the *Amazon EC2 User Guide*.

Type: ConnectionTrackingSpecification object

Required: No

**deleteOnTermination**

Indicates whether the network interface is deleted when the instance is terminated.

Type: Boolean

Required: No

**description**

A description for the network interface.

Type: String

Required: No

**deviceIndex**

The device index for the network interface attachment.

Type: Integer

Required: No

**enaQueueCount**

The number of ENA queues created with the instance.

Type: Integer

Required: No

**enaSrdSpecification**

Contains the ENA Express settings for instances launched from your launch template.

Type: LaunchTemplateEnaSrdSpecification object

Required: No

**GroupSet.N**

The IDs of one or more security groups.

Type: Array of strings

Required: No

**interfaceType**

The type of network interface.

Type: String

Required: No

**ipv4PrefixCount**

The number of IPv4 prefixes that AWS automatically assigned to the network interface.

Type: Integer

Required: No

**Ipv4PrefixSet.N**

One or more IPv4 prefixes assigned to the network interface.

Type: Array of Ipv4PrefixSpecificationResponse objects

Required: No

**ipv6AddressCount**

The number of IPv6 addresses for the network interface.

Type: Integer

Required: No

**Ipv6AddressesSet.N**

The IPv6 addresses for the network interface.

Type: Array of InstanceIpv6Address objects

Required: No

**ipv6PrefixCount**

The number of IPv6 prefixes that AWS automatically assigned to the network interface.

Type: Integer

Required: No

**Ipv6PrefixSet.N**

One or more IPv6 prefixes assigned to the network interface.

Type: Array of Ipv6PrefixSpecificationResponse objects

Required: No

**networkCardIndex**

The index of the network card.

Type: Integer

Required: No

**networkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**primaryIpv6**

The primary IPv6 address of the network interface. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. For more information about primary IPv6 addresses, see RunInstances.

Type: Boolean

Required: No

**privateIpAddress**

The primary private IPv4 address of the network interface.

Type: String

Required: No

**PrivateIpAddressesSet.N**

One or more private IPv4 addresses.

Type: Array of PrivateIpAddressSpecification objects

Required: No

**secondaryPrivateIpAddressCount**

The number of secondary private IPv4 addresses for the network interface.

Type: Integer

Required: No

**subnetId**

The ID of the subnet for the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateInstanceNetworkInterfaceSpecificationRequest

The parameters for a network interface.

## Contents

**AssociateCarrierIpAddress**

Associates a Carrier IP address with eth0 for a new network interface.

Use this option when you launch an instance in a Wavelength Zone and want to associate a Carrier IP address with the network interface. For more information about Carrier IP addresses, see Carrier IP addresses in the *AWS Wavelength Developer Guide*.

Type: Boolean

Required: No

**AssociatePublicIpAddress**

Associates a public IPv4 address with eth0 for a new network interface.

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the *Public IPv4 Address* tab on the Amazon VPC pricing page.

Type: Boolean

Required: No

**ConnectionTrackingSpecification**

A security group connection tracking specification that enables you to set the timeout for connection tracking on an Elastic network interface. For more information, see Idle connection tracking timeout in the *Amazon EC2 User Guide*.

Type: ConnectionTrackingSpecificationRequest object

Required: No

**DeleteOnTermination**

Indicates whether the network interface is deleted when the instance is terminated.

Type: Boolean

Required: No

**Description**

A description for the network interface.

Type: String

Required: No

**DeviceIndex**

The device index for the network interface attachment. The primary network interface has a device index of 0. Each network interface is of type `interface`, you must specify a device index. If you create a launch template that includes secondary network interfaces but not a primary network interface, then you must add a primary network interface as a launch parameter when you launch an instance from the template.

Type: Integer

Required: No

**EnaQueueCount**

The number of ENA queues to be created with the instance.

Type: Integer

Required: No

**EnaSrdSpecification**

Configure ENA Express settings for your launch template.

Type: EnaSrdSpecificationRequest object

Required: No

**InterfaceType**

The type of network interface. To create an Elastic Fabric Adapter (EFA), specify `efa` or `efa`. For more information, see Elastic Fabric Adapter for AI/ML and HPC workloads on Amazon EC2 in the *Amazon EC2 User Guide*.

If you are not creating an EFA, specify `interface` or omit this parameter.

If you specify `efa-only`, do not assign any IP addresses to the network interface. EFA-only network interfaces do not support IP addresses.

Valid values: `interface` | `efa` | `efa-only`

Type: String

Required: No

**Ipv4Prefix.N**

One or more IPv4 prefixes to be assigned to the network interface. You cannot use this option if you use the `Ipv4PrefixCount` option.

Type: Array of Ipv4PrefixSpecificationRequest objects

Required: No

**Ipv4PrefixCount**

The number of IPv4 prefixes to be automatically assigned to the network interface. You cannot use this option if you use the `Ipv4Prefix` option.

Type: Integer

Required: No

**Ipv6AddressCount**

The number of IPv6 addresses to assign to a network interface. Amazon EC2 automatically selects the IPv6 addresses from the subnet range. You can't use this option if specifying specific IPv6 addresses.

Type: Integer

Required: No

**Ipv6Addresses.N**

One or more specific IPv6 addresses from the IPv6 CIDR block range of your subnet. You can't use this option if you're specifying a number of IPv6 addresses.

Type: Array of InstanceIpv6AddressRequest objects

Required: No

**Ipv6Prefix.N**

One or more IPv6 prefixes to be assigned to the network interface. You cannot use this option if you use the `Ipv6PrefixCount` option.

Type: Array of Ipv6PrefixSpecificationRequest objects

Required: No

**Ipv6PrefixCount**

The number of IPv6 prefixes to be automatically assigned to the network interface. You cannot use this option if you use the `Ipv6Prefix` option.

Type: Integer

Required: No

**NetworkCardIndex**

The index of the network card. Some instance types support multiple network cards. The primary network interface must be assigned to network card index 0. The default is network card index 0.

Type: Integer

Required: No

**NetworkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**PrimaryIpv6**

The primary IPv6 address of the network interface. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. For more information about primary IPv6 addresses, see RunInstances.

Type: Boolean

Required: No

**PrivateIpAddress**

The primary private IPv4 address of the network interface.

Type: String

Required: No

**PrivateIpAddresses.N**

One or more private IPv4 addresses.

Type: Array of PrivateIpAddressSpecification objects

Required: No

**SecondaryPrivateIpAddressCount**

The number of secondary private IPv4 addresses to assign to a network interface.

Type: Integer

Required: No

**SecurityGroupId.N**

The IDs of one or more security groups.

Type: Array of strings

Required: No

**SubnetId**

The ID of the subnet for the network interface.

Type: String

Required: No

# LaunchTemplateInstanceSecondaryInterfaceSpecification

Describes a secondary interface specification in a launch template.

## Contents

**deleteOnTermination**

Indicates whether the secondary interface is deleted when the instance is terminated.

The only supported value for this field is `true`.

Type: Boolean

Required: No

**deviceIndex**

The device index for the secondary interface attachment.

Type: Integer

Required: No

**interfaceType**

The type of secondary interface.

Type: String

Valid Values: `secondary`

Required: No

**networkCardIndex**

The index of the network card.

Type: Integer

Required: No

**privateIpAddressCount**

The number of private IPv4 addresses to assign to the secondary interface.

If you specify `privateIpAddressCount` you cannot specify `privateIpAddresses`

Type: Integer

Required: No

**PrivateIpAddressesSet.N**

The private IPv4 addresses to assign to the secondary interface.

If you specify `privateIpAddresses` you cannot specify `privateIpAddressCount`

Type: Array of SecondaryInterfacePrivateIpAddressSpecification objects

Required: No

**secondarySubnetId**

The ID of the secondary subnet.

Type: String

Required: No

## See Also

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateInstanceSecondaryInterfaceSpecificationRequest

Describes a secondary interface specification for a launch template request.

## Contents

**DeleteOnTermination**

Indicates whether the secondary interface is deleted when the instance is terminated.

The only supported value for this field is `true`.

Type: Boolean

Required: No

**DeviceIndex**

The device index for the secondary interface attachment.

Type: Integer

Required: No

**InterfaceType**

The type of secondary interface.

Type: String

Valid Values: `secondary`

Required: No

**NetworkCardIndex**

The index of the network card.

Type: Integer

Required: No

**PrivateIpAddress.N**

The private IPv4 addresses to assign to the secondary interface.

Type: Array of SecondaryInterfacePrivateIpAddressSpecificationRequest objects

Required: No

**PrivateIpAddressCount**

The number of private IPv4 addresses to assign to the secondary interface.

Type: Integer

Required: No

**SecondarySubnetId**

The ID of the secondary subnet.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateLicenseConfiguration

Describes a license configuration.

## Contents

**licenseConfigurationArn**

The Amazon Resource Name (ARN) of the license configuration.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateLicenseConfigurationRequest

Describes a license configuration.

## Contents

**LicenseConfigurationArn**

The Amazon Resource Name (ARN) of the license configuration.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateNetworkPerformanceOptions

With network performance options, you can adjust your bandwidth preferences to meet the needs of the workload that runs on your instance at launch.

## Contents

### bandwidthWeighting

When you configure network bandwidth weighting, you can boost baseline bandwidth for either networking or EBS by up to 25%. The total available baseline bandwidth for your instance remains the same. The default option uses the standard bandwidth configuration for your instance type.

Type: String

Valid Values: `default | vpc-1 | ebs-1`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateNetworkPerformanceOptionsRequest

When you configure network performance options in your launch template, your instance is geared for performance improvements based on the workload that it runs as soon as it's available.

## Contents

**BandwidthWeighting**

Specify the bandwidth weighting option to boost the associated type of baseline bandwidth, as follows:

default

This option uses the standard bandwidth configuration for your instance type.

vpc-1

This option boosts your networking baseline bandwidth and reduces your EBS baseline bandwidth.

ebs-1

This option boosts your EBS baseline bandwidth and reduces your networking baseline bandwidth.

Type: String

Valid Values: `default | vpc-1 | ebs-1`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateOverrides

Describes overrides for a launch template.

## Contents

**AvailabilityZone** (request), **availabilityZone** (response)

The Availability Zone in which to launch the instances. For example, `us-east-2a`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: String

Required: No

**AvailabilityZoneId** (request), **availabilityZoneId** (response)

The ID of the Availability Zone in which to launch the instances. For example, `use2-az1`.

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: String

Required: No

**InstanceRequirements** (request), **instanceRequirements** (response)

The instance requirements. When you specify instance requirements, Amazon EC2 will identify instance types with the provided requirements, and then use your On-Demand and Spot allocation strategies to launch instances from these instance types, in the same way as when you specify a list of instance types.

> **Note**
>
> If you specify `InstanceRequirements`, you can't specify `InstanceType`.

Type: InstanceRequirements object

Required: No

**InstanceType** (request), **instanceType** (response)

The instance type.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge | g4dn.xlarge | g4dn.2xlarge | g4dn.4xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.xlarge | g5.2xlarge | g5.4xlarge | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge | g5.48xlarge | g5g.xlarge | g5g.2xlarge | g5g.4xlarge | g5g.8xlarge |

Required: No

**Priority** (request), **priority** (response)

The priority for the launch template override. The highest priority is launched first.

If `OnDemandAllocationStrategy` is set to `prioritized`, Spot Fleet uses priority to determine which launch template override to use first in fulfilling On-Demand capacity.

If the Spot `AllocationStrategy` is set to `capacityOptimizedPrioritized`, Spot Fleet uses priority on a best-effort basis to determine which launch template override to use in fulfilling Spot capacity, but optimizes for capacity first.

Valid values are whole numbers starting at `0`. The lower the number, the higher the priority. If no number is set, the launch template override has the lowest priority. You can set the same priority for different launch template overrides.

Type: Double

Required: No

**SpotPrice** (request), **spotPrice** (response)

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.

Type: String

Required: No

**SubnetId** (request), **subnetId** (response)

The ID of the subnet in which to launch the instances.

Type: String

Required: No

**WeightedCapacity** (request), **weightedCapacity** (response)

The number of units provided by the specified instance type. These are the same units that you chose to set the target capacity in terms of instances, or a performance characteristic such as vCPUs, memory, or I/O.

If the target capacity divided by this value is not a whole number, Amazon EC2 rounds the number of instances to the next whole number. If this value is not specified, the default is 1.

> **Note**
>
> When specifying weights, the price used in the `lowestPrice` and `priceCapacityOptimized` allocation strategies is per *unit* hour (where the instance price is divided by the specified weight). However, if all the specified weights are above the requested `TargetCapacity`, resulting in only 1 instance being launched, the price used is per *instance* hour.

Type: Double

Required: No

# LaunchTemplatePlacement

Describes the placement of an instance.

## Contents

**affinity**

The affinity setting for the instance on the Dedicated Host.

Type: String

Required: No

**availabilityZone**

The Availability Zone of the instance.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone of the instance.

Type: String

Required: No

**groupId**

The Group ID of the placement group. You must specify the Placement Group **Group ID** to launch an instance in a shared placement group.

Type: String

Required: No

**groupName**

The name of the placement group for the instance.

Type: String

Required: No

**hostId**

The ID of the Dedicated Host for the instance.

Type: String

Required: No

**hostResourceGroupArn**

The ARN of the host resource group in which to launch the instances.

Type: String

Required: No

**partitionNumber**

The number of the partition the instance should launch in. Valid only if the placement group strategy is set to `partition`.

Type: Integer

Required: No

**spreadDomain**

Reserved for future use.

Type: String

Required: No

**tenancy**

The tenancy of the instance. An instance with a tenancy of `dedicated` runs on single-tenant hardware.

Type: String

Valid Values: `default | dedicated | host`

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplatePlacementRequest

Describes the placement of an instance.

## Contents

**Affinity**

The affinity setting for an instance on a Dedicated Host.

Type: String

Required: No

**AvailabilityZone**

The Availability Zone for the instance.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both

Type: String

Required: No

**AvailabilityZoneId**

The ID of the Availability Zone for the instance.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both

Type: String

Required: No

**GroupId**

The Group Id of a placement group. You must specify the Placement Group **Group Id** to launch an instance in a shared placement group.

Type: String

Required: No

**GroupName**

The name of the placement group for the instance.

Type: String

Required: No

**HostId**

The ID of the Dedicated Host for the instance.

Type: String

Required: No

**HostResourceGroupArn**

The ARN of the host resource group in which to launch the instances. If you specify a host resource group ARN, omit the **Tenancy** parameter or set it to `host`.

Type: String

Required: No

**PartitionNumber**

The number of the partition the instance should launch in. Valid only if the placement group strategy is set to `partition`.

Type: Integer

Required: No

**SpreadDomain**

Reserved for future use.

Type: String

Required: No

**Tenancy**

The tenancy of the instance. An instance with a tenancy of dedicated runs on single-tenant hardware.

Type: String

Valid Values: `default | dedicated | host`

Required: No

# LaunchTemplatePrivateDnsNameOptions

Describes the options for instance hostnames.

## Contents

**enableResourceNameDnsAAAARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS AAAA records.

Type: Boolean

Required: No

**enableResourceNameDnsARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS A records.

Type: Boolean

Required: No

**hostnameType**

The type of hostname to assign to an instance.

Type: String

Valid Values: `ip-name | resource-name`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplatePrivateDnsNameOptionsRequest

Describes the options for instance hostnames.

## Contents

**EnableResourceNameDnsAAAARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS AAAA records.

Type: Boolean

Required: No

**EnableResourceNameDnsARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS A records.

Type: Boolean

Required: No

**HostnameType**

The type of hostname for Amazon EC2 instances. For IPv4 only subnets, an instance DNS name must be based on the instance IPv4 address. For IPv6 native subnets, an instance DNS name must be based on the instance ID. For dual-stack subnets, you can specify whether DNS names use the instance IPv4 address or the instance ID.

Type: String

Valid Values: `ip-name | resource-name`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# LaunchTemplatesMonitoring

Describes the monitoring for the instance.

## Contents

**enabled**

Indicates whether detailed monitoring is enabled. Otherwise, basic monitoring is enabled.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplatesMonitoringRequest

Describes the monitoring for the instance.

## Contents

### Enabled

Specify `true` to enable detailed monitoring. Otherwise, basic monitoring is enabled.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateSpecification

Describes the launch template to use.

## Contents

**LaunchTemplateId**

The ID of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Required: No

**LaunchTemplateName**

The name of the launch template.

You must specify either the launch template ID or the launch template name, but not both.

Type: String

Required: No

**Version**

The launch template version number, `$Latest`, or `$Default`.

A value of `$Latest` uses the latest version of the launch template.

A value of `$Default` uses the default version of the launch template.

Default: The default version of the launch template.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateSpotMarketOptions

The options for Spot Instances.

## Contents

**blockDurationMinutes**

The required duration for the Spot Instances (also known as Spot blocks), in minutes. This value must be a multiple of 60 (60, 120, 180, 240, 300, or 360).

Type: Integer

Required: No

**instanceInterruptionBehavior**

The behavior when a Spot Instance is interrupted.

Type: String

Valid Values: `hibernate | stop | terminate`

Required: No

**maxPrice**

The maximum hourly price you're willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price. If you do specify this parameter, it must be more than USD $0.001. Specifying a value below USD $0.001 will result in an `InvalidParameterValue` error message when the launch template is used to launch an instance.

Type: String

Required: No

**spotInstanceType**

The Spot Instance request type.

Type: String

Valid Values: `one-time | persistent`

Required: No

**validUntil**

The end date of the request. For a one-time request, the request remains active until all instances launch, the request is canceled, or this date is reached. If the request is persistent, it remains active until it is canceled or this date and time is reached.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateSpotMarketOptionsRequest

The options for Spot Instances.

## Contents

**BlockDurationMinutes**

Deprecated.

Type: Integer

Required: No

**InstanceInterruptionBehavior**

The behavior when a Spot Instance is interrupted. The default is `terminate`.

Type: String

Valid Values: `hibernate | stop | terminate`

Required: No

**MaxPrice**

The maximum hourly price you're willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price. If you do specify this parameter, it must be more than USD $0.001. Specifying a value below USD $0.001 will result in an `InvalidParameterValue` error message when the launch template is used to launch an instance.

> **Important**
>
> If you specify a maximum price, your Spot Instances will be interrupted more frequently than if you do not specify this parameter.

Type: String

Required: No

**SpotInstanceType**

The Spot Instance request type.

Type: String

Valid Values: `one-time | persistent`

Required: No

**ValidUntil**

The end date of the request, in UTC format (*YYYY-MM-DD*T*HH:MM:SS*Z). Supported only for persistent requests.

- For a persistent request, the request remains active until the `ValidUntil` date and time is reached. Otherwise, the request remains active until you cancel it.
- For a one-time request, `ValidUntil` is not supported. The request remains active until all instances launch or you cancel the request.

Default: 7 days from the current date

Type: Timestamp

Required: No

## See Also

# LaunchTemplateTagSpecification

The tags specification for the launch template.

## Contents

**resourceType**

The type of resource to tag.

Type: String

Valid Values: capacity-reservation | client-vpn-endpoint | customer-gateway | carrier-gateway | coip-pool | declarative-policies-report | dedicated-host | dhcp-options | egress-only-internet-gateway | elastic-ip | elastic-gpu | export-image-task | export-instance-task | fleet | fpga-image | host-reservation | image | image-usage-report | import-image-task | import-snapshot-task | instance | instance-event-window | internet-gateway | ipam | ipam-pool | ipam-scope | ipv4pool-ec2 | ipv6pool-ec2 | key-pair | launch-template | local-gateway | local-gateway-route-table | local-gateway-virtual-interface | local-gateway-virtual-interface-group | local-gateway-route-table-vpc-association | local-gateway-route-table-virtual-interface-group-association | natgateway | network-acl | network-interface | network-insights-analysis | network-insights-path | network-insights-access-scope | network-insights-access-scope-analysis | outpost-lag | placement-group | prefix-list | replace-root-volume-task | reserved-instances | route-table | security-group | security-group-rule | service-link-virtual-interface | snapshot | spot-fleet-request | spot-instances-request | subnet | subnet-cidr-reservation | traffic-mirror-filter | traffic-mirror-session | traffic-mirror-target | transit-gateway | transit-gateway-attachment | transit-gateway-connect-peer | transit-gateway-multicast-domain | transit-gateway-policy-table | transit-gateway-metering-policy | transit-gateway-route-table | transit-gateway-route-table-announcement | volume | vpc | vpc-endpoint | vpc-endpoint-connection | vpc-endpoint-service | vpc-endpoint-service-permission | vpc-peering-connection | vpn-connection | vpn-gateway | vpc-flow-log | capacity-reservation-fleet | traffic-mirror-filter-rule | vpc-endpoint-connection-device-type

Required: No

**TagSet.N**

The tags for the resource.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateTagSpecificationRequest

The tags specification for the resources that are created during instance launch.

## Contents

**ResourceType**

The type of resource to tag.

Valid Values lists all resource types for Amazon EC2 that can be tagged. When you create a launch template, you can specify tags for the following resource types only: `instance` | `volume` | `network-interface` | `spot-instances-request`. If the instance does not include the resource type that you specify, the instance launch fails. For example, not all instance types include a volume.

To tag a resource after it has been created, see CreateTags.

Type: String

Valid Values: `capacity-reservation | client-vpn-endpoint | customer-gateway | carrier-gateway | coip-pool | declarative-policies-report | dedicated-host | dhcp-options | egress-only-internet-gateway | elastic-ip | elastic-gpu | export-image-task | export-instance-task | fleet | fpga-image | host-reservation | image | image-usage-report | import-image-task | import-snapshot-task | instance | instance-event-window | internet-gateway | ipam | ipam-pool | ipam-scope | ipv4pool-ec2 | ipv6pool-ec2 | key-pair | launch-template | local-gateway | local-gateway-route-table | local-gateway-virtual-interface | local-gateway-virtual-interface-group | local-gateway-route-table-vpc-association | local-gateway-route-table-virtual-interface-group-association | natgateway | network-acl | network-interface | network-insights-analysis | network-insights-path | network-insights-access-scope | network-insights-access-scope-analysis | outpost-lag | placement-group | prefix-list | replace-root-volume-task | reserved-instances | route-table | security-group | security-group-rule | service-link-virtual-interface | snapshot | spot-fleet-request | spot-instances-request | subnet | subnet-cidr-reservation | traffic-mirror-filter | traffic-mirror-session | traffic-mirror-target | transit-gateway | transit-gateway-`

`attachment | transit-gateway-connect-peer | transit-gateway-multicast-domain | transit-gateway-policy-table | transit-gateway-metering-policy | transit-gateway-route-table | transit-gateway-route-table-announcement | volume | vpc | vpc-endpoint | vpc-endpoint-connection | vpc-endpoint-service | vpc-endpoint-service-permission | vpc-peering-connection | vpn-connection | vpn-gateway | vpc-flow-log | capacity-reservation-fleet | traffic-mirror-filter-rule | vpc-endpoint-connection-device-type | verified-access-instance | verified-access-group | verified-access-endpoint | verified-access-policy | verified-access-trust-provider | vpn-connection-device-type | vpc-block-public-access-exclusion | vpc-encryption-control | route-server | route-server-endpoint | route-server-peer | ipam-resource-discovery | ipam-resource-discovery-association | instance-connect-endpoint | verified-access-endpoint-target | ipam-external-resource-verification-token | capacity-block | mac-modification-task | ipam-prefix-list-resolver | ipam-policy | ipam-prefix-list-resolver-target | secondary-interface | secondary-network | secondary-subnet | capacity-manager-data-export | vpn-concentrator | ipam-pool-allocation | capacity-reservation-cancellation-quote`

Required: No

**Tag.N**

The tags to apply to the resource.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LaunchTemplateVersion

Describes a launch template version.

## Contents

**createdBy**

The principal that created the version.

Type: String

Required: No

**createTime**

The time the version was created.

Type: Timestamp

Required: No

**defaultVersion**

Indicates whether the version is the default version.

Type: Boolean

Required: No

**launchTemplateData**

Information about the launch template.

Type: ResponseLaunchTemplateData object

Required: No

**launchTemplateId**

The ID of the launch template.

Type: String

Required: No

**launchTemplateName**

The name of the launch template.

Type: String

Length Constraints: Minimum length of 3. Maximum length of 128.

Pattern: `[a-zA-Z0-9\(\)\.\-/_]+`

Required: No

**operator**

The entity that manages the launch template.

Type: OperatorResponse object

Required: No

**versionDescription**

The description for the version.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 255.

Required: No

**versionNumber**

The version number.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LicenseConfiguration

Describes a license configuration.

## Contents

**licenseConfigurationArn**

The Amazon Resource Name (ARN) of the license configuration.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LicenseConfigurationRequest

Describes a license configuration.

## Contents

**LicenseConfigurationArn**

The Amazon Resource Name (ARN) of the license configuration.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LoadBalancersConfig

Describes the Classic Load Balancers and target groups to attach to a Spot Fleet request.

## Contents

**ClassicLoadBalancersConfig** (request), **classicLoadBalancersConfig** (response)

The Classic Load Balancers.

Type: ClassicLoadBalancersConfig object

Required: No

**TargetGroupsConfig** (request), **targetGroupsConfig** (response)

The target groups.

Type: TargetGroupsConfig object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LoadPermission

Describes a load permission.

## Contents

**group**

The name of the group.

Type: String

Valid Values: `all`

Required: No

**userId**

The AWS account ID.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LoadPermissionModifications

Describes modifications to the load permissions of an Amazon FPGA image (AFI).

## Contents

**Add.N**

The load permissions to add.

Type: Array of LoadPermissionRequest objects

Required: No

**Remove.N**

The load permissions to remove.

Type: Array of LoadPermissionRequest objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LoadPermissionRequest

Describes a load permission.

## Contents

**Group**

The name of the group.

Type: String

Valid Values: `all`

Required: No

**UserId**

The AWS account ID.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LocalGateway

Describes a local gateway.

## Contents

**localGatewayId**

The ID of the local gateway.

Type: String

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the local gateway.

Type: String

Required: No

**state**

The state of the local gateway.

Type: String

Required: No

**TagSet.N**

The tags assigned to the local gateway.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LocalGatewayRoute

Describes a route for a local gateway route table.

## Contents

**coipPoolId**

The ID of the customer-owned address pool.

Type: String

Required: No

**destinationCidrBlock**

The CIDR block used for destination matches.

Type: String

Required: No

**destinationPrefixListId**

The ID of the prefix list.

Type: String

Required: No

**localGatewayRouteTableArn**

The Amazon Resource Name (ARN) of the local gateway route table.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**localGatewayRouteTableId**

The ID of the local gateway route table.

Type: String

Required: No

**localGatewayVirtualInterfaceGroupId**

The ID of the virtual interface group.

Type: String

Required: No

**networkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the local gateway route.

Type: String

Required: No

**state**

The state of the route.

Type: String

Valid Values: `pending | active | blackhole | deleting | deleted`

Required: No

**subnetId**

The ID of the subnet.

Type: String

Required: No

**type**

The route type.

Type: String

Valid Values: `static | propagated`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LocalGatewayRouteTable

Describes a local gateway route table.

## Contents

**localGatewayId**

The ID of the local gateway.

Type: String

Required: No

**localGatewayRouteTableArn**

The Amazon Resource Name (ARN) of the local gateway route table.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**localGatewayRouteTableId**

The ID of the local gateway route table.

Type: String

Required: No

**mode**

The mode of the local gateway route table.

Type: String

Valid Values: `direct-vpc-routing | coip`

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the local gateway route table.

Type: String

Required: No

**state**

The state of the local gateway route table.

Type: String

Required: No

**stateReason**

Information about the state change.

Type: StateReason object

Required: No

**TagSet.N**

The tags assigned to the local gateway route table.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LocalGatewayRouteTableVirtualInterfaceGroupAssociation

Describes an association between a local gateway route table and a virtual interface group.

## Contents

**localGatewayId**

The ID of the local gateway.

Type: String

Required: No

**localGatewayRouteTableArn**

The Amazon Resource Name (ARN) of the local gateway route table for the virtual interface group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**localGatewayRouteTableId**

The ID of the local gateway route table.

Type: String

Required: No

**localGatewayRouteTableVirtualInterfaceGroupAssociationId**

The ID of the association.

Type: String

Required: No

**localGatewayVirtualInterfaceGroupId**

The ID of the virtual interface group.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the local gateway virtual interface group association.

Type: String

Required: No

**state**

The state of the association.

Type: String

Required: No

**TagSet.N**

The tags assigned to the association.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LocalGatewayRouteTableVpcAssociation

Describes an association between a local gateway route table and a VPC.

## Contents

**localGatewayId**

The ID of the local gateway.

Type: String

Required: No

**localGatewayRouteTableArn**

The Amazon Resource Name (ARN) of the local gateway route table for the association.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**localGatewayRouteTableId**

The ID of the local gateway route table.

Type: String

Required: No

**localGatewayRouteTableVpcAssociationId**

The ID of the association.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the local gateway route table for the association.

Type: String

Required: No

**state**

The state of the association.

Type: String

Required: No

**TagSet.N**

The tags assigned to the association.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LocalGatewayVirtualInterface

Describes a local gateway virtual interface.

## Contents

**configurationState**

The current state of the local gateway virtual interface.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**localAddress**

The local address.

Type: String

Required: No

**localBgpAsn**

The Border Gateway Protocol (BGP) Autonomous System Number (ASN) of the local gateway.

Type: Integer

Required: No

**localGatewayId**

The ID of the local gateway.

Type: String

Required: No

**localGatewayVirtualInterfaceArn**

The Amazon Resource Number (ARN) of the local gateway virtual interface.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**localGatewayVirtualInterfaceGroupId**

The ID of the local gateway virtual interface group.

Type: String

Required: No

**localGatewayVirtualInterfaceId**

The ID of the virtual interface.

Type: String

Required: No

**outpostLagId**

The Outpost LAG ID.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the local gateway virtual interface.

Type: String

Required: No

**peerAddress**

The peer address.

Type: String

Required: No

**peerBgpAsn**

The peer BGP ASN.

Type: Integer

Required: No

**peerBgpAsnExtended**

The extended 32-bit ASN of the BGP peer for use with larger ASN values.

Type: Long

Required: No

**TagSet.N**

The tags assigned to the virtual interface.

Type: Array of Tag objects

Required: No

**vlan**

The ID of the VLAN.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LocalGatewayVirtualInterfaceGroup

Describes a local gateway virtual interface group.

## Contents

**configurationState**

The current state of the local gateway virtual interface group.

Type: String

Valid Values: `pending | incomplete | available | deleting | deleted`

Required: No

**localBgpAsn**

The Autonomous System Number(ASN) for the local Border Gateway Protocol (BGP).

Type: Integer

Required: No

**localBgpAsnExtended**

The extended 32-bit ASN for the local BGP configuration.

Type: Long

Required: No

**localGatewayId**

The ID of the local gateway.

Type: String

Required: No

**localGatewayVirtualInterfaceGroupArn**

The Amazon Resource Number (ARN) of the local gateway virtual interface group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**localGatewayVirtualInterfaceGroupId**

The ID of the virtual interface group.

Type: String

Required: No

**LocalGatewayVirtualInterfaceIdSet.N**

The IDs of the virtual interfaces.

Type: Array of strings

Required: No

**ownerId**

The ID of the AWS account that owns the local gateway virtual interface group.

Type: String

Required: No

**TagSet.N**

The tags assigned to the virtual interface group.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# LockedSnapshotsInfo

Information about a locked snapshot.

## Contents

**coolOffPeriod**

The compliance mode cooling-off period, in hours.

Type: Integer

Required: No

**coolOffPeriodExpiresOn**

The date and time at which the compliance mode cooling-off period expires, in the UTC time zone (YYYY-MM-DDThh:mm:ss.sssZ).

Type: Timestamp

Required: No

**lockCreatedOn**

The date and time at which the snapshot was locked, in the UTC time zone (YYYY-MM-DDThh:mm:ss.sssZ).

Type: Timestamp

Required: No

**lockDuration**

The period of time for which the snapshot is locked, in days.

Type: Integer

Required: No

**lockDurationStartTime**

The date and time at which the lock duration started, in the UTC time zone (YYYY-MM-DDThh:mm:ss.sssZ).

If you lock a snapshot that is in the `pending` state, the lock duration starts only once the snapshot enters the `completed` state.

Type: Timestamp

Required: No

**lockExpiresOn**

The date and time at which the lock will expire, in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`).

Type: Timestamp

Required: No

**lockState**

The state of the snapshot lock. Valid states include:

- `compliance-cooloff` - The snapshot has been locked in compliance mode but it is still within the cooling-off period. The snapshot can't be deleted, but it can be unlocked and the lock settings can be modified by users with appropriate permissions.
- `governance` - The snapshot is locked in governance mode. The snapshot can't be deleted, but it can be unlocked and the lock settings can be modified by users with appropriate permissions.
- `compliance` - The snapshot is locked in compliance mode and the cooling-off period has expired. The snapshot can't be unlocked or deleted. The lock duration can only be increased by users with appropriate permissions.
- `expired` - The snapshot was locked in compliance or governance mode but the lock duration has expired. The snapshot is not locked and can be deleted.

Type: String

Valid Values: `compliance | governance | compliance-cooloff | expired`

Required: No

**ownerId**

The account ID of the AWS account that owns the snapshot.

Type: String

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MacHost

Information about the EC2 Mac Dedicated Host.

## Contents

**hostId**

The EC2 Mac Dedicated Host ID.

Type: String

Required: No

**MacOSLatestSupportedVersionSet.N**

The latest macOS versions that the EC2 Mac Dedicated Host can launch without being upgraded.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MacModificationTask

Information about a System Integrity Protection (SIP) modification task or volume ownership delegation task for an Amazon EC2 Mac instance.

## Contents

**instanceId**

The ID of the Amazon EC2 Mac instance.

Type: String

Required: No

**macModificationTaskId**

The ID of task.

Type: String

Required: No

**macSystemIntegrityProtectionConfig**

[SIP modification tasks only] Information about the SIP configuration.

Type: MacSystemIntegrityProtectionConfiguration object

Required: No

**startTime**

The date and time the task was created, in the UTC timezone (`YYYY-MM-DDThh:mm:ss.sssZ`).

Type: Timestamp

Required: No

**TagSet.N**

The tags assigned to the task.

Type: Array of Tag objects

Required: No

**taskState**

The state of the task.

Type: String

Valid Values: `successful | failed | in-progress | pending`

Required: No

**taskType**

The type of task.

Type: String

Valid Values: `sip-modification | volume-ownership-delegation`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MacSystemIntegrityProtectionConfiguration

Describes the configuration for a System Integrity Protection (SIP) modification task.

## Contents

**appleInternal**

Indicates whether Apple Internal was enabled or disabled by the task.

Type: String

Valid Values: `enabled | disabled`

Required: No

**baseSystem**

Indicates whether Base System was enabled or disabled by the task.

Type: String

Valid Values: `enabled | disabled`

Required: No

**debuggingRestrictions**

Indicates whether Debugging Restrictions was enabled or disabled by the task.

Type: String

Valid Values: `enabled | disabled`

Required: No

**dTraceRestrictions**

Indicates whether Dtrace Restrictions was enabled or disabled by the task.

Type: String

Valid Values: `enabled | disabled`

Required: No

**filesystemProtections**

Indicates whether Filesystem Protections was enabled or disabled by the task.

Type: String

Valid Values: `enabled | disabled`

Required: No

**kextSigning**

Indicates whether Kext Signing was enabled or disabled by the task.

Type: String

Valid Values: `enabled | disabled`

Required: No

**nvramProtections**

Indicates whether NVRAM Protections was enabled or disabled by the task.

Type: String

Valid Values: `enabled | disabled`

Required: No

**status**

Indicates SIP was enabled or disabled by the task.

Type: String

Valid Values: `enabled | disabled`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MacSystemIntegrityProtectionConfigurationRequest

Describes a custom configuration for a System Integrity Protection (SIP) modification task.

## Contents

**AppleInternal**

Enables or disables Apple Internal.

Type: String

Valid Values: `enabled | disabled`

Required: No

**BaseSystem**

Enables or disables Base System.

Type: String

Valid Values: `enabled | disabled`

Required: No

**DebuggingRestrictions**

Enables or disables Debugging Restrictions.

Type: String

Valid Values: `enabled | disabled`

Required: No

**DTraceRestrictions**

Enables or disables Dtrace Restrictions.

Type: String

Valid Values: `enabled | disabled`

Required: No

**FilesystemProtections**

Enables or disables Filesystem Protections.

Type: String

Valid Values: `enabled | disabled`

Required: No

**KextSigning**

Enables or disables Kext Signing.

Type: String

Valid Values: `enabled | disabled`

Required: No

**NvramProtections**

Enables or disables Nvram Protections.

Type: String

Valid Values: `enabled | disabled`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MaintenanceDetails

Details for Site-to-Site VPN tunnel endpoint maintenance events.

## Contents

**lastMaintenanceApplied**

Timestamp of last applied maintenance.

Type: Timestamp

Required: No

**maintenanceAutoAppliedAfter**

The timestamp after which AWS will automatically apply maintenance.

Type: Timestamp

Required: No

**pendingMaintenance**

Verify existence of a pending maintenance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ManagedPrefixList

Describes a managed prefix list.

## Contents

**addressFamily**

The IP address version.

Type: String

Required: No

**ipamPrefixListResolverSyncEnabled**

Indicates whether synchronization with an IPAM prefix list resolver is enabled for this managed prefix list. When enabled, the prefix list CIDRs are automatically updated based on the resolver's CIDR selection rules.

Type: Boolean

Required: No

**ipamPrefixListResolverTargetId**

The ID of the IPAM prefix list resolver target associated with this managed prefix list. When set, this prefix list becomes an IPAM managed prefix list.

An IPAM-managed prefix list is a customer-managed prefix list that has been associated with an IPAM prefix list resolver target. When a prefix list becomes IPAM managed, its CIDRs are automatically synchronized based on the IPAM prefix list resolver's CIDR selection rules, and direct CIDR modifications are restricted.

Type: String

Required: No

**maxEntries**

The maximum number of entries for the prefix list.

Type: Integer

Required: No

**ownerId**

The ID of the owner of the prefix list.

Type: String

Required: No

**prefixListArn**

The Amazon Resource Name (ARN) for the prefix list.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**prefixListId**

The ID of the prefix list.

Type: String

Required: No

**prefixListName**

The name of the prefix list.

Type: String

Required: No

**state**

The current state of the prefix list.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | modify-in-progress | modify-complete | modify-failed | restore-in-progress | restore-complete | restore-failed | delete-in-progress | delete-complete | delete-failed`

Required: No

**stateMessage**

The state message.

Type: String

Required: No

**TagSet.N**

The tags for the prefix list.

Type: Array of Tag objects

Required: No

**version**

The version of the prefix list.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ManagedResourceVisibilitySettings

Describes the managed resource visibility settings for the account.

## Contents

**defaultVisibility**

The default visibility setting for managed resources. A value of `hidden` indicates that managed resources are not included in Describe operation responses by default. A value of `visible` indicates that managed resources are included by default.

Type: String

Valid Values: `hidden | visible`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MediaAcceleratorInfo

Describes the media accelerators for the instance type.

## Contents

**Accelerators.N**

Describes the media accelerators for the instance type.

Type: Array of MediaDeviceInfo objects

Required: No

**totalMediaMemoryInMiB**

The total size of the memory for the media accelerators for the instance type, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MediaDeviceInfo

Describes the media accelerators for the instance type.

## Contents

**count**

The number of media accelerators for the instance type.

Type: Integer

Required: No

**manufacturer**

The manufacturer of the media accelerator.

Type: String

Required: No

**memoryInfo**

Describes the memory available to the media accelerator.

Type: MediaDeviceMemoryInfo object

Required: No

**name**

The name of the media accelerator.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MediaDeviceMemoryInfo

Describes the memory available to the media accelerator.

## Contents

**sizeInMiB**

The size of the memory available to each media accelerator, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MemoryGiBPerVCpu

The minimum and maximum amount of memory per vCPU, in GiB.

## Contents

**Max** (request), **max** (response)

The maximum amount of memory per vCPU, in GiB. If this parameter is not specified, there is no maximum limit.

Type: Double

Required: No

**Min** (request), **min** (response)

The minimum amount of memory per vCPU, in GiB. If this parameter is not specified, there is no minimum limit.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MemoryGiBPerVCpuRequest

The minimum and maximum amount of memory per vCPU, in GiB.

## Contents

**Max**

The maximum amount of memory per vCPU, in GiB. To specify no maximum limit, omit this parameter.

Type: Double

Required: No

**Min**

The minimum amount of memory per vCPU, in GiB. To specify no minimum limit, omit this parameter.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MemoryInfo

Describes the memory for the instance type.

## Contents

**sizeInMiB**

The size of the memory, in MiB.

Type: Long

Required: No

## See Also

- AWS SDK for Ruby V3

# MemoryMiB

The minimum and maximum amount of memory, in MiB.

## Contents

**Max** (request), **max** (response)

The maximum amount of memory, in MiB. If this parameter is not specified, there is no maximum limit.

Type: Integer

Required: No

**Min** (request), **min** (response)

The minimum amount of memory, in MiB. If this parameter is not specified, there is no minimum limit.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MemoryMiBRequest

The minimum and maximum amount of memory, in MiB.

## Contents

**Min**

The minimum amount of memory, in MiB. To specify no minimum limit, specify `0`.

Type: Integer

Required: Yes

**Max**

The maximum amount of memory, in MiB. To specify no maximum limit, omit this parameter.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MetricDataResult

Contains a single data point from a capacity metrics query, including the dimension values, timestamp, and metric values for that specific combination.

## Contents

**dimension**

The dimension values that identify this specific data point, such as account ID, region, and instance family.

Type: CapacityManagerDimension object

Required: No

**MetricValueSet.N**

The metric values and statistics for this data point, containing the actual capacity usage numbers.

Type: Array of MetricValue objects

Required: No

**timestamp**

The timestamp for this data point, indicating when the capacity usage occurred.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MetricPoint

Indicates whether the network was healthy or degraded at a particular point. The value is aggregated from the `startDate` to the `endDate`. Currently only `five_minutes` is supported.

## Contents

**endDate**

The end date for the metric point. The ending time must be formatted as `yyyy-mm-ddThh:mm:ss`. For example, `2022-06-12T12:00:00.000Z`.

Type: Timestamp

Required: No

**startDate**

The start date for the metric point. The starting date for the metric point. The starting time must be formatted as `yyyy-mm-ddThh:mm:ss`. For example, `2022-06-10T12:00:00.000Z`.

Type: Timestamp

Required: No

**status**

The status of the metric point.

Type: String

Required: No

**value**

Type: Float

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MetricValue

Represents a single metric value with its associated statistic, such as the sum or average of unused capacity hours.

## Contents

**metric**

The name of the metric.

Type: String

Valid Values: `reservation-total-capacity-hrs-vcpu | reservation-total-capacity-hrs-inst | reservation-max-size-vcpu | reservation-max-size-inst | reservation-min-size-vcpu | reservation-min-size-inst | reservation-unused-total-capacity-hrs-vcpu | reservation-unused-total-capacity-hrs-inst | reservation-unused-total-estimated-cost | reservation-max-unused-size-vcpu | reservation-max-unused-size-inst | reservation-min-unused-size-vcpu | reservation-min-unused-size-inst | reservation-max-utilization | reservation-min-utilization | reservation-avg-utilization-vcpu | reservation-avg-utilization-inst | reservation-total-count | reservation-total-estimated-cost | reservation-avg-future-size-vcpu | reservation-avg-future-size-inst | reservation-min-future-size-vcpu | reservation-min-future-size-inst | reservation-max-future-size-vcpu | reservation-max-future-size-inst | reservation-avg-committed-size-vcpu | reservation-avg-committed-size-inst | reservation-max-committed-size-vcpu | reservation-max-committed-size-inst | reservation-min-committed-size-vcpu | reservation-min-committed-size-inst | reserved-total-usage-hrs-vcpu | reserved-total-usage-hrs-inst | reserved-total-estimated-cost | unreserved-total-usage-hrs-vcpu | unreserved-total-usage-hrs-inst | unreserved-total-estimated-cost | spot-total-usage-hrs-vcpu | spot-total-usage-hrs-inst | spot-total-estimated-cost | spot-avg-run-time-before-interruption-inst | spot-max-run-time-before-interruption-inst | spot-min-run-time-before-interruption-inst`

Required: No

**value**

The numerical value of the metric for the specified statistic and time period.

Type: Double

Required: No

## See Also

# ModifyTransitGatewayOptions

The transit gateway options.

## Contents

**AddTransitGatewayCidrBlocks.N**

Adds IPv4 or IPv6 CIDR blocks for the transit gateway. Must be a size /24 CIDR block or larger for IPv4, or a size /64 CIDR block or larger for IPv6.

Type: Array of strings

Required: No

**AmazonSideAsn**

A private Autonomous System Number (ASN) for the Amazon side of a BGP session. The range is 64512 to 65534 for 16-bit ASNs and 4200000000 to 4294967294 for 32-bit ASNs.

The modify ASN operation is not allowed on a transit gateway if it has the following attachments:

- Dynamic VPN
- Static VPN
- Direct Connect Gateway
- Connect

You must first delete all transit gateway attachments configured prior to modifying the ASN on the transit gateway.

Type: Long

Required: No

**AssociationDefaultRouteTableId**

The ID of the default association route table.

Type: String

Required: No

**AutoAcceptSharedAttachments**

Enable or disable automatic acceptance of attachment requests.

Type: String

Valid Values: `enable | disable`

Required: No

**DefaultRouteTableAssociation**

Enable or disable automatic association with the default association route table.

Type: String

Valid Values: `enable | disable`

Required: No

**DefaultRouteTablePropagation**

Indicates whether resource attachments automatically propagate routes to the default propagation route table. Enabled by default. If `defaultRouteTablePropagation` is set to `enable`, AWS Transit Gateway will create the default transit gateway route table.

Type: String

Valid Values: `enable | disable`

Required: No

**DnsSupport**

Enable or disable DNS support.

Type: String

Valid Values: `enable | disable`

Required: No

**EncryptionSupport**

Enable or disable encryption support for VPC Encryption Control.

Type: String

Valid Values: `enable | disable`

Required: No

**PropagationDefaultRouteTableId**

The ID of the default propagation route table.

Type: String

Required: No

**RemoveTransitGatewayCidrBlocks.N**

Removes CIDR blocks for the transit gateway.

Type: Array of strings

Required: No

**SecurityGroupReferencingSupport**

Enables you to reference a security group across VPCs attached to a transit gateway to simplify security group management.

This option is disabled by default.

For more information about security group referencing, see Security group referencing in the *AWS Transit Gateways Guide*.

Type: String

Valid Values: `enable | disable`

Required: No

**VpnEcmpSupport**

Enable or disable Equal Cost Multipath Protocol support.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyTransitGatewayVpcAttachmentRequestOptions

Describes the options for a VPC attachment.

## Contents

**ApplianceModeSupport**

Enable or disable support for appliance mode. If enabled, a traffic flow between a source and destination uses the same Availability Zone for the VPC attachment for the lifetime of that flow. The default is `disable`.

Type: String

Valid Values: `enable | disable`

Required: No

**DnsSupport**

Enable or disable DNS support. The default is `enable`.

Type: String

Valid Values: `enable | disable`

Required: No

**Ipv6Support**

Enable or disable IPv6 support. The default is `enable`.

Type: String

Valid Values: `enable | disable`

Required: No

**SecurityGroupReferencingSupport**

Enables you to reference a security group across VPCs attached to a transit gateway to simplify security group management.

This option is disabled by default.

For more information about security group referencing, see Security group referencing in the *AWS Transit Gateways Guide*.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyVerifiedAccessEndpointCidrOptions

The CIDR options for a Verified Access endpoint.

## Contents

**PortRange.N**

The port ranges.

Type: Array of ModifyVerifiedAccessEndpointPortRange objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyVerifiedAccessEndpointEniOptions

Describes the options when modifying a Verified Access endpoint with the `network-interface` type.

## Contents

**Port**

The IP port number.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**PortRange.N**

The port ranges.

Type: Array of ModifyVerifiedAccessEndpointPortRange objects

Required: No

**Protocol**

The IP protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# ModifyVerifiedAccessEndpointLoadBalancerOptions

Describes a load balancer when creating an AWS Verified Access endpoint using the `load-balancer` type.

## Contents

**Port**

The IP port number.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**PortRange.N**

The port ranges.

Type: Array of ModifyVerifiedAccessEndpointPortRange objects

Required: No

**Protocol**

The IP protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

**SubnetId.N**

The IDs of the subnets.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyVerifiedAccessEndpointPortRange

Describes the port range for a Verified Access endpoint.

## Contents

**FromPort**

The start of the port range.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**ToPort**

The end of the port range.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyVerifiedAccessEndpointRdsOptions

The RDS options for a Verified Access endpoint.

## Contents

**Port**

The port.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**RdsEndpoint**

The RDS endpoint.

Type: String

Required: No

**SubnetId.N**

The IDs of the subnets.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyVerifiedAccessNativeApplicationOidcOptions

Describes the OpenID Connect (OIDC) options.

## Contents

**AuthorizationEndpoint**

The authorization endpoint of the IdP.

Type: String

Required: No

**ClientId**

The OAuth 2.0 client identifier.

Type: String

Required: No

**ClientSecret**

The OAuth 2.0 client secret.

Type: String

Required: No

**Issuer**

The OIDC issuer identifier of the IdP.

Type: String

Required: No

**PublicSigningKeyEndpoint**

The public signing key endpoint.

Type: String

Required: No

**Scope**

The set of user claims to be requested from the IdP.

Type: String

Required: No

**TokenEndpoint**

The token endpoint of the IdP.

Type: String

Required: No

**UserInfoEndpoint**

The user info endpoint of the IdP.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyVerifiedAccessTrustProviderDeviceOptions

Modifies the configuration of the specified device-based AWS Verified Access trust provider.

## Contents

**PublicSigningKeyUrl**

The URL AWS Verified Access will use to verify the authenticity of the device tokens.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyVerifiedAccessTrustProviderOidcOptions

Options for an OpenID Connect-compatible user-identity trust provider.

## Contents

**AuthorizationEndpoint**

The OIDC authorization endpoint.

Type: String

Required: No

**ClientId**

The client identifier.

Type: String

Required: No

**ClientSecret**

The client secret.

Type: String

Required: No

**Issuer**

The OIDC issuer.

Type: String

Required: No

**Scope**

OpenID Connect (OIDC) scopes are used by an application during authentication to authorize access to a user's details. Each scope returns a specific set of user attributes.

Type: String

Required: No

**TokenEndpoint**

The OIDC token endpoint.

Type: String

Required: No

**UserInfoEndpoint**

The OIDC user info endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ModifyVpnTunnelOptionsSpecification

The AWS Site-to-Site VPN tunnel options to modify.

## Contents

**DPDTimeoutAction**

The action to take after DPD timeout occurs. Specify `restart` to restart the IKE initiation. Specify `clear` to end the IKE session.

Valid Values: `clear` | none | `restart`

Default: `clear`

Type: String

Required: No

**DPDTimeoutSeconds**

The number of seconds after which a DPD timeout occurs. A DPD timeout of 40 seconds means that the VPN endpoint will consider the peer dead 30 seconds after the first failed keep-alive.

Constraints: A value greater than or equal to 30.

Default: `40`

Type: Integer

Required: No

**EnableTunnelLifecycleControl**

Turn on or off tunnel endpoint lifecycle control feature.

Type: Boolean

Required: No

**IKEVersion.N**

The IKE versions that are permitted for the VPN tunnel.

Valid values: `ikev1` | `ikev2`

Type: Array of IKEVersionsRequestListValue objects

Required: No

**LogOptions**

Options for logging VPN tunnel activity.

Type: VpnTunnelLogOptionsSpecification object

Required: No

**Phase1DHGroupNumber.N**

One or more Diffie-Hellman group numbers that are permitted for the VPN tunnel for phase 1 IKE negotiations.

Valid values: `2` | `14` | `15` | `16` | `17` | `18` | `19` | `20` | `21` | `22` | `23` | `24`

Type: Array of Phase1DHGroupNumbersRequestListValue objects

Required: No

**Phase1EncryptionAlgorithm.N**

One or more encryption algorithms that are permitted for the VPN tunnel for phase 1 IKE negotiations.

Valid values: `AES128` | `AES256` | `AES128-GCM-16` | `AES256-GCM-16`

Type: Array of Phase1EncryptionAlgorithmsRequestListValue objects

Required: No

**Phase1IntegrityAlgorithm.N**

One or more integrity algorithms that are permitted for the VPN tunnel for phase 1 IKE negotiations.

Valid values: `SHA1` | `SHA2-256` | `SHA2-384` | `SHA2-512`

Type: Array of Phase1IntegrityAlgorithmsRequestListValue objects

Required: No

**Phase1LifetimeSeconds**

The lifetime for phase 1 of the IKE negotiation, in seconds.

Constraints: A value between 900 and 28,800.

Default: `28800`

Type: Integer

Required: No

**Phase2DHGroupNumber.N**

One or more Diffie-Hellman group numbers that are permitted for the VPN tunnel for phase 2 IKE negotiations.

Valid values: 2 | 5 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24

Type: Array of Phase2DHGroupNumbersRequestListValue objects

Required: No

**Phase2EncryptionAlgorithm.N**

One or more encryption algorithms that are permitted for the VPN tunnel for phase 2 IKE negotiations.

Valid values: `AES128` | `AES256` | `AES128-GCM-16` | `AES256-GCM-16`

Type: Array of Phase2EncryptionAlgorithmsRequestListValue objects

Required: No

**Phase2IntegrityAlgorithm.N**

One or more integrity algorithms that are permitted for the VPN tunnel for phase 2 IKE negotiations.

Valid values: `SHA1` | `SHA2-256` | `SHA2-384` | `SHA2-512`

Type: Array of Phase2IntegrityAlgorithmsRequestListValue objects

Required: No

**Phase2LifetimeSeconds**

The lifetime for phase 2 of the IKE negotiation, in seconds.

Constraints: A value between 900 and 3,600. The value must be less than the value for `Phase1LifetimeSeconds`.

Default: `3600`

Type: Integer

Required: No

**PreSharedKey**

The pre-shared key (PSK) to establish initial authentication between the virtual private gateway and the customer gateway.

Constraints: Allowed characters are alphanumeric characters, periods (.), and underscores (_). Must be between 8 and 64 characters in length and cannot start with zero (0).

Type: String

Required: No

**RekeyFuzzPercentage**

The percentage of the rekey window (determined by `RekeyMarginTimeSeconds`) during which the rekey time is randomly selected.

Constraints: A value between 0 and 100.

Default: `100`

Type: Integer

Required: No

**RekeyMarginTimeSeconds**

The margin time, in seconds, before the phase 2 lifetime expires, during which the AWS side of the VPN connection performs an IKE rekey. The exact time of the rekey is randomly selected based on the value for `RekeyFuzzPercentage`.

Constraints: A value between 60 and half of `Phase2LifetimeSeconds`.

Default: 270

Type: Integer

Required: No

**ReplayWindowSize**

The number of packets in an IKE replay window.

Constraints: A value between 64 and 2048.

Default: 1024

Type: Integer

Required: No

**StartupAction**

The action to take when the establishing the tunnel for the VPN connection. By default, your customer gateway device must initiate the IKE negotiation and bring up the tunnel. Specify start for AWS to initiate the IKE negotiation.

Valid Values: add | start

Default: add

Type: String

Required: No

**TunnelInsideCidr**

The range of inside IPv4 addresses for the tunnel. Any specified CIDR blocks must be unique across all VPN connections that use the same virtual private gateway.

Constraints: A size /30 CIDR block from the 169.254.0.0/16 range. The following CIDR blocks are reserved and cannot be used:

- 169.254.0.0/30
- 169.254.1.0/30
- 169.254.2.0/30
- 169.254.3.0/30

- `169.254.4.0/30`
- `169.254.5.0/30`
- `169.254.169.252/30`

Type: String

Required: No

**TunnelInsideIpv6Cidr**

The range of inside IPv6 addresses for the tunnel. Any specified CIDR blocks must be unique across all VPN connections that use the same transit gateway.

Constraints: A size /126 CIDR block from the local `fd00::/8` range.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Monitoring

Describes the monitoring of an instance.

## Contents

**state**

Indicates whether detailed monitoring is enabled. Otherwise, basic monitoring is enabled.

Type: String

Valid Values: `disabled | disabling | enabled | pending`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# MovingAddressStatus

> **Note**
>
> This action is deprecated.

Describes the status of a moving Elastic IP address.

## Contents

**moveStatus**

The status of the Elastic IP address that's being moved or restored.

Type: String

Valid Values: `movingToVpc | restoringToClassic`

Required: No

**publicIp**

The Elastic IP address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NatGateway

Describes a NAT gateway.

## Contents

**AttachedApplianceSet.N**

The proxy appliances attached to the NAT Gateway for filtering and inspecting traffic to prevent data exfiltration.

Type: Array of NatGatewayAttachedAppliance objects

Required: No

**autoProvisionZones**

For regional NAT gateways only: Indicates whether AWS automatically manages AZ coverage. When enabled, the NAT gateway associates EIPs in all AZs where your VPC has subnets to handle outbound NAT traffic, expands to new AZs when you create subnets there, and retracts from AZs where you've removed all subnets. When disabled, you must manually manage which AZs the NAT gateway supports and their corresponding EIPs.

A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

For more information, see Regional NAT gateways for automatic multi-AZ expansion in the *Amazon VPC User Guide*.

Type: String

Valid Values: `enabled | disabled`

Required: No

**autoScalingIps**

For regional NAT gateways only: Indicates whether AWS automatically allocates additional Elastic IP addresses (EIPs) in an AZ when the NAT gateway needs more ports due to increased concurrent connections to a single destination from that AZ.

For more information, see Regional NAT gateways for automatic multi-AZ expansion in the *Amazon VPC User Guide*.

Type: String

Valid Values: `enabled | disabled`

Required: No

**availabilityMode**

Indicates whether this is a zonal (single-AZ) or regional (multi-AZ) NAT gateway.

A zonal NAT gateway is a NAT Gateway that provides redundancy and scalability within a single availability zone. A regional NAT gateway is a single NAT Gateway that works across multiple availability zones (AZs) in your VPC, providing redundancy, scalability and availability across all the AZs in a Region.

For more information, see Regional NAT gateways for automatic multi-AZ expansion in the *Amazon VPC User Guide*.

Type: String

Valid Values: `zonal | regional`

Required: No

**connectivityType**

Indicates whether the NAT gateway supports public or private connectivity.

Type: String

Valid Values: `private | public`

Required: No

**createTime**

The date and time the NAT gateway was created.

Type: Timestamp

Required: No

**deleteTime**

The date and time the NAT gateway was deleted, if applicable.

Type: Timestamp

Required: No

**failureCode**

If the NAT gateway could not be created, specifies the error code for the failure. (`InsufficientFreeAddressesInSubnet` | `Gateway.NotAttached` | `InvalidAllocationID.NotFound` | `Resource.AlreadyAssociated` | `InternalError` | `InvalidSubnetID.NotFound`)

Type: String

Required: No

**failureMessage**

If the NAT gateway could not be created, specifies the error message for the failure, that corresponds to the error code.

- For InsufficientFreeAddressesInSubnet: "Subnet has insufficient free addresses to create this NAT gateway"
- For Gateway.NotAttached: "Network vpc-xxxxxxxx has no Internet gateway attached"
- For InvalidAllocationID.NotFound: "Elastic IP address eipalloc-xxxxxxxx could not be associated with this NAT gateway"
- For Resource.AlreadyAssociated: "Elastic IP address eipalloc-xxxxxxxx is already associated"
- For InternalError: "Network interface eni-xxxxxxxx, created and used internally by this NAT gateway is in an invalid state. Please try again."
- For InvalidSubnetID.NotFound: "The specified subnet subnet-xxxxxxxx does not exist or could not be found."

Type: String

Required: No

**NatGatewayAddressSet.N**

Information about the IP addresses and network interface associated with the NAT gateway.

Type: Array of NatGatewayAddress objects

Required: No

**natGatewayId**

The ID of the NAT gateway.

Type: String

Required: No

**provisionedBandwidth**

Reserved. If you need to sustain traffic greater than the documented limits, contact AWS Support.

Type: ProvisionedBandwidth object

Required: No

**routeTableId**

For regional NAT gateways only, this is the ID of the NAT gateway.

Type: String

Required: No

**state**

The state of the NAT gateway.

- `pending`: The NAT gateway is being created and is not ready to process traffic.
- `failed`: The NAT gateway could not be created. Check the `failureCode` and `failureMessage` fields for the reason.
- `available`: The NAT gateway is able to process traffic. This status remains until you delete the NAT gateway, and does not indicate the health of the NAT gateway.
- `deleting`: The NAT gateway is in the process of being terminated and may still be processing traffic.
- `deleted`: The NAT gateway has been terminated and is no longer processing traffic.

Type: String

Valid Values: `pending | failed | available | deleting | deleted`

Required: No

**subnetId**

The ID of the subnet in which the NAT gateway is located.

Type: String

Required: No

**TagSet.N**

The tags for the NAT gateway.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC in which the NAT gateway is located.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NatGatewayAddress

Describes the IP addresses and network interface associated with a NAT gateway.

## Contents

**allocationId**

[Public NAT gateway only] The allocation ID of the Elastic IP address that's associated with the NAT gateway.

Type: String

Required: No

**associationId**

[Public NAT gateway only] The association ID of the Elastic IP address that's associated with the NAT gateway.

Type: String

Required: No

**availabilityZone**

The Availability Zone where this Elastic IP address (EIP) is being used to handle outbound NAT traffic.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone where this Elastic IP address (EIP) is being used to handle outbound NAT traffic. Use this instead of AvailabilityZone for consistent identification of AZs across AWS Regions.

Type: String

Required: No

**failureMessage**

The address failure message.

Type: String

Required: No

**isPrimary**

Defines if the IP address is the primary address.

Type: Boolean

Required: No

**networkInterfaceId**

The ID of the network interface associated with the NAT gateway.

Type: String

Required: No

**privateIp**

The private IP address associated with the NAT gateway.

Type: String

Required: No

**publicIp**

[Public NAT gateway only] The Elastic IP address associated with the NAT gateway.

Type: String

Required: No

**status**

The address status.

Type: String

Valid Values: `assigning | unassigning | associating | disassociating | succeeded | failed`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NatGatewayAttachedAppliance

Information about an appliance attached to a NAT Gateway, providing managed security solutions for traffic filtering and inspection.

## Contents

**applianceArn**

The Amazon Resource Name (ARN) of the attached appliance, identifying the specific proxy or security appliance resource.

Type: String

Required: No

**attachmentState**

The current attachment state of the appliance.

Type: String

Valid Values: `attaching | attached | detaching | detached | attach-failed | detach-failed`

Required: No

**failureCode**

The failure code if the appliance attachment or modification operation failed.

Type: String

Required: No

**failureMessage**

A descriptive message explaining the failure if the appliance attachment or modification operation failed.

Type: String

Required: No

**modificationState**

The current modification state of the appliance.

Type: String

Valid Values: `modifying | completed | failed`

Required: No

**type**

The type of appliance attached to the NAT Gateway. For network firewall proxy functionality, this will be "network-firewall-proxy".

Type: String

Valid Values: `network-firewall-proxy`

Required: No

**vpcEndpointId**

The VPC endpoint ID used to route traffic from application VPCs to the proxy for inspection and filtering.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NativeApplicationOidcOptions

Describes the OpenID Connect (OIDC) options.

## Contents

**authorizationEndpoint**

The authorization endpoint of the IdP.

Type: String

Required: No

**clientId**

The OAuth 2.0 client identifier.

Type: String

Required: No

**issuer**

The OIDC issuer identifier of the IdP.

Type: String

Required: No

**publicSigningKeyEndpoint**

The public signing key endpoint.

Type: String

Required: No

**scope**

The set of user claims to be requested from the IdP.

Type: String

Required: No

**tokenEndpoint**

The token endpoint of the IdP.

Type: String

Required: No

**userInfoEndpoint**

The user info endpoint of the IdP.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkAcl

Describes a network ACL.

## Contents

**AssociationSet.N**

Any associations between the network ACL and your subnets

Type: Array of NetworkAclAssociation objects

Required: No

**default**

Indicates whether this is the default network ACL for the VPC.

Type: Boolean

Required: No

**EntrySet.N**

The entries (rules) in the network ACL.

Type: Array of NetworkAclEntry objects

Required: No

**networkAclId**

The ID of the network ACL.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the network ACL.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the network ACL.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC for the network ACL.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkAclAssociation

Describes an association between a network ACL and a subnet.

## Contents

**networkAclAssociationId**

The ID of the association between a network ACL and a subnet.

Type: String

Required: No

**networkAclId**

The ID of the network ACL.

Type: String

Required: No

**subnetId**

The ID of the subnet.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkAclEntry

Describes an entry in a network ACL.

## Contents

**cidrBlock**

The IPv4 network range to allow or deny, in CIDR notation.

Type: String

Required: No

**egress**

Indicates whether the rule is an egress rule (applied to traffic leaving the subnet).

Type: Boolean

Required: No

**icmpTypeCode**

ICMP protocol: The ICMP type and code.

Type: IcmpTypeCode object

Required: No

**ipv6CidrBlock**

The IPv6 network range to allow or deny, in CIDR notation.

Type: String

Required: No

**portRange**

TCP or UDP protocols: The range of ports the rule applies to.

Type: PortRange object

Required: No

**protocol**

The protocol number. A value of "-1" means all protocols.

Type: String

Required: No

**ruleAction**

Indicates whether to allow or deny the traffic that matches the rule.

Type: String

Valid Values: `allow | deny`

Required: No

**ruleNumber**

The rule number for the entry. ACL entries are processed in ascending order by rule number.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkBandwidthGbps

The minimum and maximum amount of network bandwidth, in gigabits per second (Gbps).

> **Note**
>
> Setting the minimum bandwidth does not guarantee that your instance will achieve the minimum bandwidth. Amazon EC2 will identify instance types that support the specified minimum bandwidth, but the actual bandwidth of your instance might go below the specified minimum at times. For more information, see Available instance bandwidth in the *Amazon EC2 User Guide*.

## Contents

**Max** (request), **max** (response)

The maximum amount of network bandwidth, in Gbps. If this parameter is not specified, there is no maximum limit.

Type: Double

Required: No

**Min** (request), **min** (response)

The minimum amount of network bandwidth, in Gbps. If this parameter is not specified, there is no minimum limit.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# NetworkBandwidthGbpsRequest

The minimum and maximum amount of network bandwidth, in gigabits per second (Gbps).

> **Note**
>
> Setting the minimum bandwidth does not guarantee that your instance will achieve the minimum bandwidth. Amazon EC2 will identify instance types that support the specified minimum bandwidth, but the actual bandwidth of your instance might go below the specified minimum at times. For more information, see Available instance bandwidth in the *Amazon EC2 User Guide*.

## Contents

**Max**

The maximum amount of network bandwidth, in Gbps. To specify no maximum limit, omit this parameter.

Type: Double

Required: No

**Min**

The minimum amount of network bandwidth, in Gbps. To specify no minimum limit, omit this parameter.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# NetworkCardInfo

Describes the network card support of the instance type.

## Contents

**additionalFlexibleNetworkInterfaces**

The number of additional network interfaces that can be attached to an instance when using flexible Elastic Network Adapter (ENA) queues. This number is in addition to the base number specified by `maximumNetworkInterfaces`.

Type: Integer

Required: No

**baselineBandwidthInGbps**

The baseline network performance of the network card, in Gbps.

Type: Double

Required: No

**defaultEnaQueueCountPerInterface**

The default number of the ENA queues for each interface.

Type: Integer

Required: No

**maximumEnaQueueCount**

The maximum number of the ENA queues.

Type: Integer

Required: No

**maximumEnaQueueCountPerInterface**

The maximum number of the ENA queues for each interface.

Type: Integer

Required: No

**maximumNetworkInterfaces**

The maximum number of network interfaces for the network card.

Type: Integer

Required: No

**networkCardIndex**

The index of the network card.

Type: Integer

Required: No

**networkPerformance**

The network performance of the network card.

Type: String

Required: No

**peakBandwidthInGbps**

The peak (burst) network performance of the network card, in Gbps.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInfo

Describes the networking features of the instance type.

## Contents

**BandwidthWeightings.N**

A list of valid settings for configurable bandwidth weighting for the instance type, if supported.

Type: Array of strings

Valid Values: `default | vpc-1 | ebs-1`

Required: No

**connectionTrackingConfiguration**

Indicates conntrack information for the instance type

Type: DefaultConnectionTrackingConfiguration object

Required: No

**defaultNetworkCardIndex**

The index of the default network card, starting at 0.

Type: Integer

Required: No

**efaInfo**

Describes the Elastic Fabric Adapters for the instance type.

Type: EfaInfo object

Required: No

**efaSupported**

Indicates whether Elastic Fabric Adapter (EFA) is supported.

Type: Boolean

Required: No

**enaSrdSupported**

Indicates whether the instance type supports ENA Express. ENA Express uses AWS Scalable Reliable Datagram (SRD) technology to increase the maximum bandwidth used per stream and minimize tail latency of network traffic between EC2 instances.

Type: Boolean

Required: No

**enaSupport**

Indicates whether Elastic Network Adapter (ENA) is supported.

Type: String

Valid Values: `unsupported | supported | required`

Required: No

**encryptionInTransitSupported**

Indicates whether the instance type automatically encrypts in-transit traffic between instances.

Type: Boolean

Required: No

**flexibleEnaQueuesSupport**

Indicates whether changing the number of ENA queues is supported.

Type: String

Valid Values: `unsupported | supported`

Required: No

**ipv4AddressesPerInterface**

The maximum number of IPv4 addresses per network interface.

Type: Integer

Required: No

**ipv4AddressesPerSecondaryInterface**

The maximum number of IPv4 addresses per secondary interface.

Type: Integer

Required: No

**ipv6AddressesPerInterface**

The maximum number of IPv6 addresses per network interface.

Type: Integer

Required: No

**ipv6Supported**

Indicates whether IPv6 is supported.

Type: Boolean

Required: No

**maximumNetworkCards**

The maximum number of physical network cards that can be allocated to the instance.

Type: Integer

Required: No

**maximumNetworkInterfaces**

The maximum number of network interfaces for the instance type.

Type: Integer

Required: No

**maximumSecondaryNetworkInterfaces**

The maximum number of secondary interfaces for the instance type.

Type: Integer

Required: No

**NetworkCards.N**

Describes the network cards for the instance type.

Type: Array of NetworkCardInfo objects

Required: No

**networkPerformance**

The network performance.

Type: String

Required: No

**secondaryNetworkSupported**

Indicates whether secondary interface attachments from secondary network are supported.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInsightsAccessScope

Describes a Network Access Scope.

## Contents

**createdDate**

The creation date.

Type: Timestamp

Required: No

**networkInsightsAccessScopeArn**

The Amazon Resource Name (ARN) of the Network Access Scope.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**networkInsightsAccessScopeId**

The ID of the Network Access Scope.

Type: String

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

**updatedDate**

The last updated date.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInsightsAccessScopeAnalysis

Describes a Network Access Scope analysis.

## Contents

**analyzedEniCount**

The number of network interfaces analyzed.

Type: Integer

Required: No

**endDate**

The analysis end date.

Type: Timestamp

Required: No

**findingsFound**

Indicates whether there are findings.

Type: String

Valid Values: `true | false | unknown`

Required: No

**networkInsightsAccessScopeAnalysisArn**

The Amazon Resource Name (ARN) of the Network Access Scope analysis.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**networkInsightsAccessScopeAnalysisId**

The ID of the Network Access Scope analysis.

Type: String

Required: No

**networkInsightsAccessScopeId**

The ID of the Network Access Scope.

Type: String

Required: No

**startDate**

The analysis start date.

Type: Timestamp

Required: No

**status**

The status.

Type: String

Valid Values: `running | succeeded | failed`

Required: No

**statusMessage**

The status message.

Type: String

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

**warningMessage**

The warning message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInsightsAccessScopeContent

Describes the Network Access Scope content.

## Contents

**ExcludePathSet.N**

The paths to exclude.

Type: Array of AccessScopePath objects

Required: No

**MatchPathSet.N**

The paths to match.

Type: Array of AccessScopePath objects

Required: No

**networkInsightsAccessScopeId**

The ID of the Network Access Scope.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInsightsAnalysis

Describes a network insights analysis.

## Contents

**AdditionalAccountSet.N**

The member accounts that contain resources that the path can traverse.

Type: Array of strings

Required: No

**AlternatePathHintSet.N**

Potential intermediate components.

Type: Array of AlternatePathHint objects

Required: No

**ExplanationSet.N**

The explanations. For more information, see Reachability Analyzer explanation codes.

Type: Array of Explanation objects

Required: No

**FilterInArnSet.N**

The Amazon Resource Names (ARN) of the resources that the path must traverse.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**FilterOutArnSet.N**

The Amazon Resource Names (ARN) of the resources that the path must ignore.

Type: Array of strings

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ForwardPathComponentSet.N**

The components in the path from source to destination.

Type: Array of PathComponent objects

Required: No

**networkInsightsAnalysisArn**

The Amazon Resource Name (ARN) of the network insights analysis.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**networkInsightsAnalysisId**

The ID of the network insights analysis.

Type: String

Required: No

**networkInsightsPathId**

The ID of the path.

Type: String

Required: No

**networkPathFound**

Indicates whether the destination is reachable from the source.

Type: Boolean

Required: No

**ReturnPathComponentSet.N**

The components in the path from destination to source.

Type: Array of PathComponent objects

Required: No

**startDate**

The time the analysis started.

Type: Timestamp

Required: No

**status**

The status of the network insights analysis.

Type: String

Valid Values: `running | succeeded | failed`

Required: No

**statusMessage**

The status message, if the status is `failed`.

Type: String

Required: No

**SuggestedAccountSet.N**

Potential intermediate accounts.

Type: Array of strings

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

**warningMessage**

The warning message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInsightsPath

Describes a path.

## Contents

**createdDate**

The time stamp when the path was created.

Type: Timestamp

Required: No

**destination**

The ID of the destination.

Type: String

Required: No

**destinationArn**

The Amazon Resource Name (ARN) of the destination.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**destinationIp**

The IP address of the destination.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**destinationPort**

The destination port.

Type: Integer

Required: No

**filterAtDestination**

Scopes the analysis to network paths that match specific filters at the destination.

Type: PathFilter object

Required: No

**filterAtSource**

Scopes the analysis to network paths that match specific filters at the source.

Type: PathFilter object

Required: No

**networkInsightsPathArn**

The Amazon Resource Name (ARN) of the path.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**networkInsightsPathId**

The ID of the path.

Type: String

Required: No

**protocol**

The protocol.

Type: String

Valid Values: `tcp | udp`

Required: No

**source**

The ID of the source.

Type: String

Required: No

**sourceArn**

The Amazon Resource Name (ARN) of the source.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**sourceIp**

The IP address of the source.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**TagSet.N**

The tags associated with the path.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterface

Describes a network interface.

## Contents

**AssociatedSubnetSet.N**

The subnets associated with this network interface.

Type: Array of strings

Required: No

**association**

The association information for an Elastic IP address (IPv4) associated with the network interface.

Type: NetworkInterfaceAssociation object

Required: No

**attachment**

The network interface attachment.

Type: NetworkInterfaceAttachment object

Required: No

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**connectionTrackingConfiguration**

A security group connection tracking configuration that enables you to set the timeout for connection tracking on an Elastic network interface. For more information, see Connection tracking timeouts in the *Amazon EC2 User Guide*.

Type: ConnectionTrackingConfiguration object

Required: No

**denyAllIgwTraffic**

Indicates whether a network interface with an IPv6 address is unreachable from the public internet. If the value is `true`, inbound traffic from the internet is dropped and you cannot assign an elastic IP address to the network interface. The network interface is reachable from peered VPCs and resources connected through a transit gateway, including on-premises networks.

Type: Boolean

Required: No

**description**

A description.

Type: String

Required: No

**GroupSet.N**

Any security groups for the network interface.

Type: Array of GroupIdentifier objects

Required: No

**interfaceType**

The type of network interface.

Type: String

Valid Values: `api_gateway_managed | aws_codestar_connections_managed | branch | ec2_instance_connect_endpoint | efa | efa-only | efs | evs | gateway_load_balancer | gateway_load_balancer_endpoint | global_accelerator_managed | interface | iot_rules_managed | lambda | load_balancer | nat_gateway | network_load_balancer | quicksight | transit_gateway | trunk | vpc_endpoint`

Required: No

**Ipv4PrefixSet.N**

The IPv4 prefixes that are assigned to the network interface.

Type: Array of Ipv4PrefixSpecification objects

Required: No

**ipv6Address**

The IPv6 globally unique address associated with the network interface.

Type: String

Required: No

**Ipv6AddressesSet.N**

The IPv6 addresses associated with the network interface.

Type: Array of NetworkInterfaceIpv6Address objects

Required: No

**ipv6Native**

Indicates whether this is an IPv6 only network interface.

Type: Boolean

Required: No

**Ipv6PrefixSet.N**

The IPv6 prefixes that are assigned to the network interface.

Type: Array of Ipv6PrefixSpecification objects

Required: No

**macAddress**

The MAC address.

Type: String

Required: No

**networkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**operator**

The service provider that manages the network interface.

Type: OperatorResponse object

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost.

Type: String

Required: No

**ownerId**

The AWS account ID of the owner of the network interface.

Type: String

Required: No

**privateDnsName**

The private hostname. For more information, see EC2 instance hostnames, DNS names, and domains in the *Amazon EC2 User Guide*.

Type: String

Required: No

**privateIpAddress**

The IPv4 address of the network interface within the subnet.

Type: String

Required: No

**PrivateIpAddressesSet.N**

The private IPv4 addresses associated with the network interface.

Type: Array of NetworkInterfacePrivateIpAddress objects

Required: No

**publicDnsName**

A public hostname. For more information, see EC2 instance hostnames, DNS names, and domains in the *Amazon EC2 User Guide*.

Type: String

Required: No

**publicIpDnsNameOptions**

Public hostname type options. For more information, see EC2 instance hostnames, DNS names, and domains in the *Amazon EC2 User Guide*.

Type: PublicIpDnsNameOptions object

Required: No

**requesterId**

The alias or AWS account ID of the principal or service that created the network interface.

Type: String

Required: No

**requesterManaged**

Indicates whether the network interface is being managed by AWS.

Type: Boolean

Required: No

**sourceDestCheck**

Indicates whether source/destination checking is enabled.

Type: Boolean

Required: No

**status**

The status of the network interface.

Type: String

Valid Values: `available | associated | attaching | in-use | detaching`

Required: No

**subnetId**

The ID of the subnet.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the network interface.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterfaceAssociation

Describes association information for an Elastic IP address (IPv4 only), or a Carrier IP address (for a network interface which resides in a subnet in a Wavelength Zone).

## Contents

**allocationId**

The allocation ID.

Type: String

Required: No

**associationId**

The association ID.

Type: String

Required: No

**carrierIp**

The carrier IP address associated with the network interface.

This option is only available when the network interface is in a subnet which is associated with a Wavelength Zone.

Type: String

Required: No

**customerOwnedIp**

The customer-owned IP address associated with the network interface.

Type: String

Required: No

**ipOwnerId**

The ID of the Elastic IP address owner.

Type: String

Required: No

**publicDnsName**

The public DNS name.

Type: String

Required: No

**publicIp**

The address of the Elastic IP address bound to the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterfaceAttachment

Describes a network interface attachment.

## Contents

**attachmentId**

The ID of the network interface attachment.

Type: String

Required: No

**attachTime**

The timestamp indicating when the attachment initiated.

Type: Timestamp

Required: No

**deleteOnTermination**

Indicates whether the network interface is deleted when the instance is terminated.

Type: Boolean

Required: No

**deviceIndex**

The device index of the network interface attachment on the instance.

Type: Integer

Required: No

**enaQueueCount**

The number of ENA queues created with the instance.

Type: Integer

Required: No

**enaSrdSpecification**

Configures ENA Express for the network interface that this action attaches to the instance.

Type: AttachmentEnaSrdSpecification object

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

**instanceOwnerId**

The AWS account ID of the owner of the instance.

Type: String

Required: No

**networkCardIndex**

The index of the network card.

Type: Integer

Required: No

**status**

The attachment state.

Type: String

Valid Values: `attaching | attached | detaching | detached`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterfaceAttachmentChanges

Describes an attachment change.

## Contents

**AttachmentId**

The ID of the network interface attachment.

Type: String

Required: No

**DefaultEnaQueueCount**

The default number of the ENA queues.

Type: Boolean

Required: No

**DeleteOnTermination**

Indicates whether the network interface is deleted when the instance is terminated.

Type: Boolean

Required: No

**EnaQueueCount**

The number of ENA queues to be created with the instance.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterfaceCount

The minimum and maximum number of network interfaces.

## Contents

**Max** (request), **max** (response)

The maximum number of network interfaces. If this parameter is not specified, there is no maximum limit.

Type: Integer

Required: No

**Min** (request), **min** (response)

The minimum number of network interfaces. If this parameter is not specified, there is no minimum limit.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterfaceCountRequest

The minimum and maximum number of network interfaces.

## Contents

**Max**

The maximum number of network interfaces. To specify no maximum limit, omit this parameter.

Type: Integer

Required: No

**Min**

The minimum number of network interfaces. To specify no minimum limit, omit this parameter.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterfaceIpv6Address

Describes an IPv6 address associated with a network interface.

## Contents

**ipv6Address**

The IPv6 address.

Type: String

Required: No

**isPrimaryIpv6**

Determines if an IPv6 address associated with a network interface is the primary IPv6 address. When you enable an IPv6 GUA address to be a primary IPv6, the first IPv6 GUA will be made the primary IPv6 address until the instance is terminated or the network interface is detached. For more information, see ModifyNetworkInterfaceAttribute.

Type: Boolean

Required: No

**publicIpv6DnsName**

An IPv6-enabled public hostname for a network interface. Requests from within the VPC or from the internet resolve to the IPv6 GUA of the network interface. For more information, see EC2 instance hostnames, DNS names, and domains in the *Amazon EC2 User Guide*.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# NetworkInterfacePermission

Describes a permission for a network interface.

## Contents

**awsAccountId**

The AWS account ID.

Type: String

Required: No

**awsService**

The AWS service.

Type: String

Required: No

**networkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**networkInterfacePermissionId**

The ID of the network interface permission.

Type: String

Required: No

**permission**

The type of permission.

Type: String

Valid Values: `INSTANCE-ATTACH | EIP-ASSOCIATE`

Required: No

**permissionState**

Information about the state of the permission.

Type: NetworkInterfacePermissionState object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterfacePermissionState

Describes the state of a network interface permission.

## Contents

**state**

The state of the permission.

Type: String

Valid Values: `pending | granted | revoking | revoked`

Required: No

**statusMessage**

A status message, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NetworkInterfacePrivateIpAddress

Describes the private IPv4 address of a network interface.

## Contents

**association**

The association information for an Elastic IP address (IPv4) associated with the network interface.

Type: NetworkInterfaceAssociation object

Required: No

**primary**

Indicates whether this IPv4 address is the primary private IPv4 address of the network interface.

Type: Boolean

Required: No

**privateDnsName**

The private DNS name.

Type: String

Required: No

**privateIpAddress**

The private IPv4 address.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NeuronDeviceCoreInfo

Describes the cores available to the neuron accelerator.

## Contents

**count**

The number of cores available to the neuron accelerator.

Type: Integer

Required: No

**version**

The version of the neuron accelerator.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NeuronDeviceInfo

Describes the neuron accelerators for the instance type.

## Contents

**coreInfo**

Describes the cores available to each neuron accelerator.

Type: NeuronDeviceCoreInfo object

Required: No

**count**

The number of neuron accelerators for the instance type.

Type: Integer

Required: No

**memoryInfo**

Describes the memory available to each neuron accelerator.

Type: NeuronDeviceMemoryInfo object

Required: No

**name**

The name of the neuron accelerator.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NeuronDeviceMemoryInfo

Describes the memory available to the neuron accelerator.

## Contents

**sizeInMiB**

The size of the memory available to the neuron accelerator, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NeuronInfo

Describes the neuron accelerators for the instance type.

## Contents

**NeuronDevices.N**

Describes the neuron accelerators for the instance type.

Type: Array of NeuronDeviceInfo objects

Required: No

**totalNeuronDeviceMemoryInMiB**

The total size of the memory for the neuron accelerators for the instance type, in MiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NewDhcpConfiguration

Describes a DHCP configuration option.

## Contents

**Key**

The name of a DHCP option.

Type: String

Required: No

**Value.N**

The values for the DHCP option.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# NitroTpmInfo

Describes the supported NitroTPM versions for the instance type.

## Contents

**SupportedVersions.N**

Indicates the supported NitroTPM versions.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# OidcOptions

Describes the options for an OpenID Connect-compatible user-identity trust provider.

## Contents

**authorizationEndpoint**

The OIDC authorization endpoint.

Type: String

Required: No

**clientId**

The client identifier.

Type: String

Required: No

**clientSecret**

The client secret.

Type: String

Required: No

**issuer**

The OIDC issuer.

Type: String

Required: No

**scope**

The OpenID Connect (OIDC) scope specified.

Type: String

Required: No

**tokenEndpoint**

The OIDC token endpoint.

Type: String

Required: No

**userInfoEndpoint**

The OIDC user info endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# OnDemandOptions

Describes the configuration of On-Demand Instances in an EC2 Fleet.

## Contents

**allocationStrategy**

The strategy that determines the order of the launch template overrides to use in fulfilling On-Demand capacity.

`lowest-price` - EC2 Fleet uses price to determine the order, launching the lowest price first.

`prioritized` - EC2 Fleet uses the priority that you assigned to each launch template override, launching the highest priority first.

Default: `lowest-price`

Type: String

Valid Values: `lowest-price | prioritized`

Required: No

**capacityReservationOptions**

The strategy for using unused Capacity Reservations for fulfilling On-Demand capacity.

Supported only for fleets of type `instant`.

Type: CapacityReservationOptions object

Required: No

**maxTotalPrice**

The maximum amount per hour for On-Demand Instances that you're willing to pay.

> **Note**
>
> If your fleet includes T instances that are configured as `unlimited`, and if their average CPU usage exceeds the baseline utilization, you will incur a charge for surplus credits. The `maxTotalPrice` does not account for surplus credits, and, if you use surplus

credits, your final cost might be higher than what you specified for `maxTotalPrice`. For more information, see Surplus credits can incur charges in the *Amazon EC2 User Guide*.

Type: String

Required: No

**minTargetCapacity**

The minimum target capacity for On-Demand Instances in the fleet. If this minimum capacity isn't reached, no instances are launched.

Constraints: Maximum value of `1000`. Supported only for fleets of type `instant`.

At least one of the following must be specified: `SingleAvailabilityZone` | `SingleInstanceType`

Type: Integer

Required: No

**singleAvailabilityZone**

Indicates that the fleet launches all On-Demand Instances into a single Availability Zone.

Supported only for fleets of type `instant`.

Type: Boolean

Required: No

**singleInstanceType**

Indicates that the fleet uses a single instance type to launch all On-Demand Instances in the fleet.

Supported only for fleets of type `instant`.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# OnDemandOptionsRequest

Describes the configuration of On-Demand Instances in an EC2 Fleet.

## Contents

**AllocationStrategy**

The strategy that determines the order of the launch template overrides to use in fulfilling On-Demand capacity.

`lowest-price` - EC2 Fleet uses price to determine the order, launching the lowest price first.

`prioritized` - EC2 Fleet uses the priority that you assigned to each launch template override, launching the highest priority first.

Default: `lowest-price`

Type: String

Valid Values: `lowest-price | prioritized`

Required: No

**CapacityReservationOptions**

The strategy for using unused Capacity Reservations for fulfilling On-Demand capacity.

Supported only for fleets of type `instant`.

Type: CapacityReservationOptionsRequest object

Required: No

**MaxTotalPrice**

The maximum amount per hour for On-Demand Instances that you're willing to pay.

> **Note**
>
> If your fleet includes T instances that are configured as `unlimited`, and if their average CPU usage exceeds the baseline utilization, you will incur a charge for surplus credits. The `MaxTotalPrice` does not account for surplus credits, and, if you use surplus

credits, your final cost might be higher than what you specified for `MaxTotalPrice`. For more information, see Surplus credits can incur charges in the *Amazon EC2 User Guide*.

Type: String

Required: No

**MinTargetCapacity**

The minimum target capacity for On-Demand Instances in the fleet. If this minimum capacity isn't reached, no instances are launched.

Constraints: Maximum value of `1000`. Supported only for fleets of type `instant`.

At least one of the following must be specified: `SingleAvailabilityZone` | `SingleInstanceType`

Type: Integer

Required: No

**SingleAvailabilityZone**

Indicates that the fleet launches all On-Demand Instances into a single Availability Zone.

Supported only for fleets of type `instant`.

Type: Boolean

Required: No

**SingleInstanceType**

Indicates that the fleet uses a single instance type to launch all On-Demand Instances in the fleet.

Supported only for fleets of type `instant`.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# OperatorRequest

The service provider that manages the resource.

## Contents

**Principal**

The service provider that manages the resource.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# OperatorResponse

Describes whether the resource is managed by a service provider and, if so, describes the service provider that manages it.

## Contents

**hiddenByDefault**

If `true`, the resource is hidden by default based on the managed resource visibility settings for the account.

Type: Boolean

Required: No

**managed**

If `true`, the resource is managed by a service provider.

Type: Boolean

Required: No

**principal**

If `managed` is `true`, then the principal is returned. The principal is the service provider that manages the resource.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# OutpostLag

Describes an Outpost link aggregation group (LAG).

## Contents

**LocalGatewayVirtualInterfaceIdSet.N**

The IDs of the local gateway virtual interfaces associated with the Outpost LAG.

Type: Array of strings

Required: No

**outpostArn**

The Amazon Resource Number (ARN) of the Outpost LAG.

Type: String

Required: No

**outpostLagId**

The ID of the Outpost LAG.

Type: String

Required: No

**ownerId**

The ID of the Outpost LAG owner.

Type: String

Required: No

**ServiceLinkVirtualInterfaceIdSet.N**

The service link virtual interface IDs associated with the Outpost LAG.

Type: Array of strings

Required: No

**state**

The current state of the Outpost LAG.

Type: String

Required: No

**TagSet.N**

The tags associated with the Outpost LAG.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PacketHeaderStatement

Describes a packet header statement.

## Contents

**DestinationAddressSet.N**

The destination addresses.

Type: Array of strings

Required: No

**DestinationPortSet.N**

The destination ports.

Type: Array of strings

Required: No

**DestinationPrefixListSet.N**

The destination prefix lists.

Type: Array of strings

Required: No

**ProtocolSet.N**

The protocols.

Type: Array of strings

Valid Values: `tcp | udp`

Required: No

**SourceAddressSet.N**

The source addresses.

Type: Array of strings

Required: No

**SourcePortSet.N**

The source ports.

Type: Array of strings

Required: No

**SourcePrefixListSet.N**

The source prefix lists.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PacketHeaderStatementRequest

Describes a packet header statement.

## Contents

**DestinationAddress.N**

The destination addresses.

Type: Array of strings

Required: No

**DestinationPort.N**

The destination ports.

Type: Array of strings

Required: No

**DestinationPrefixList.N**

The destination prefix lists.

Type: Array of strings

Required: No

**Protocol.N**

The protocols.

Type: Array of strings

Valid Values: `tcp | udp`

Required: No

**SourceAddress.N**

The source addresses.

Type: Array of strings

Required: No

**SourcePort.N**

The source ports.

Type: Array of strings

Required: No

**SourcePrefixList.N**

The source prefix lists.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PathComponent

Describes a path component.

## Contents

**aclRule**

The network ACL rule.

Type: AnalysisAclRule object

Required: No

**AdditionalDetailSet.N**

The additional details.

Type: Array of AdditionalDetail objects

Required: No

**attachedTo**

The resource to which the path component is attached.

Type: AnalysisComponent object

Required: No

**component**

The component.

Type: AnalysisComponent object

Required: No

**destinationVpc**

The destination VPC.

Type: AnalysisComponent object

Required: No

**elasticLoadBalancerListener**

The load balancer listener.

Type: AnalysisComponent object

Required: No

**ExplanationSet.N**

The explanation codes.

Type: Array of Explanation objects

Required: No

**firewallStatefulRule**

The Network Firewall stateful rule.

Type: FirewallStatefulRule object

Required: No

**firewallStatelessRule**

The Network Firewall stateless rule.

Type: FirewallStatelessRule object

Required: No

**inboundHeader**

The inbound header.

Type: AnalysisPacketHeader object

Required: No

**outboundHeader**

The outbound header.

Type: AnalysisPacketHeader object

Required: No

**routeTableRoute**

The route table route.

Type: AnalysisRouteTableRoute object

Required: No

**securityGroupRule**

The security group rule.

Type: AnalysisSecurityGroupRule object

Required: No

**sequenceNumber**

The sequence number.

Type: Integer

Required: No

**serviceName**

The name of the VPC endpoint service.

Type: String

Required: No

**sourceVpc**

The source VPC.

Type: AnalysisComponent object

Required: No

**subnet**

The subnet.

Type: AnalysisComponent object

Required: No

**transitGateway**

The transit gateway.

Type: AnalysisComponent object

Required: No

**transitGatewayRouteTableRoute**

The route in a transit gateway route table.

Type: TransitGatewayRouteTableRoute object

Required: No

**vpc**

The component VPC.

Type: AnalysisComponent object

Required: No

## See Also

- AWS SDK for Ruby V3

# PathFilter

Describes a set of filters for a path analysis. Use path filters to scope the analysis when there can be multiple resulting paths.

## Contents

**destinationAddress**

The destination IPv4 address.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**destinationPortRange**

The destination port range.

Type: FilterPortRange object

Required: No

**sourceAddress**

The source IPv4 address.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**sourcePortRange**

The source port range.

Type: FilterPortRange object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PathRequestFilter

Describes a set of filters for a path analysis. Use path filters to scope the analysis when there can be multiple resulting paths.

## Contents

**DestinationAddress**

The destination IPv4 address.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**DestinationPortRange**

The destination port range.

Type: RequestFilterPortRange object

Required: No

**SourceAddress**

The source IPv4 address.

Type: String

Length Constraints: Minimum length of 0. Maximum length of 15.

Pattern: `^([0-9]{1,3}.){3}[0-9]{1,3}$`

Required: No

**SourcePortRange**

The source port range.

Type: RequestFilterPortRange object

Required: No

## See Also

# PathStatement

Describes a path statement.

## Contents

**packetHeaderStatement**

The packet header statement.

Type: PacketHeaderStatement object

Required: No

**resourceStatement**

The resource statement.

Type: ResourceStatement object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PathStatementRequest

Describes a path statement.

## Contents

**PacketHeaderStatement**

The packet header statement.

Type: PacketHeaderStatementRequest object

Required: No

**ResourceStatement**

The resource statement.

Type: ResourceStatementRequest object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PciId

Describes the data that identifies an Amazon FPGA image (AFI) on the PCI bus.

## Contents

**DeviceId**

The ID of the device.

Type: String

Required: No

**SubsystemId**

The ID of the subsystem.

Type: String

Required: No

**SubsystemVendorId**

The ID of the vendor for the subsystem.

Type: String

Required: No

**VendorId**

The ID of the vendor.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PeeringAttachmentStatus

The status of the transit gateway peering attachment.

## Contents

**code**

The status code.

Type: String

Required: No

**message**

The status message, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PeeringConnectionOptions

Describes the VPC peering connection options.

## Contents

**allowDnsResolutionFromRemoteVpc**

If true, the public DNS hostnames of instances in the specified VPC resolve to private IP addresses when queried from instances in the peer VPC.

Type: Boolean

Required: No

**allowEgressFromLocalClassicLinkToRemoteVpc**

Deprecated.

Type: Boolean

Required: No

**allowEgressFromLocalVpcToRemoteClassicLink**

Deprecated.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PeeringConnectionOptionsRequest

The VPC peering connection options.

## Contents

**AllowDnsResolutionFromRemoteVpc**

If true, enables a local VPC to resolve public DNS hostnames to private IP addresses when queried from instances in the peer VPC.

Type: Boolean

Required: No

**AllowEgressFromLocalClassicLinkToRemoteVpc**

Deprecated.

Type: Boolean

Required: No

**AllowEgressFromLocalVpcToRemoteClassicLink**

Deprecated.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PeeringTgwInfo

Information about the transit gateway in the peering attachment.

## Contents

**coreNetworkId**

The ID of the core network where the transit gateway peer is located.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the transit gateway.

Type: String

Required: No

**region**

The Region of the transit gateway.

Type: String

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

## See Also

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PerformanceFactorReference

Specify an instance family to use as the baseline reference for CPU performance. All instance types that match your specified attributes will be compared against the CPU performance of the referenced instance family, regardless of CPU manufacturer or architecture.

> **Note**
>
> Currently, only one instance family can be specified in the list.

## Contents

**InstanceFamily** (request), **instanceFamily** (response)

The instance family to use as a baseline reference.

> **Note**
>
> Ensure that you specify the correct value for the instance family. The instance family is everything before the period (`.`) in the instance type name. For example, in the instance type `c6i.large`, the instance family is `c6i`, not `c6`. For more information, see Amazon EC2 instance type naming conventions in *Amazon EC2 Instance Types*.

The following instance families are *not supported* for performance protection:

- `c1`
- `g3 | g3s`
- `hpc7g`
- `m1 | m2`
- `mac1 | mac2 | mac2-m1ultra | mac2-m2 | mac2-m2pro`
- `p3dn | p4d | p5`
- `t1`
- `u-12tb1 | u-18tb1 | u-24tb1 | u-3tb1 | u-6tb1 | u-9tb1 | u7i-12tb | u7in-16tb | u7in-24tb | u7in-32tb`

If you enable performance protection by specifying a supported instance family, the returned instance types will exclude the above unsupported instance families.

If you specify an unsupported instance family as a value for baseline performance, the API returns an empty response for GetInstanceTypesFromInstanceRequirements and an exception for CreateFleet, RequestSpotFleet, ModifyFleet, and ModifySpotFleetRequest.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PerformanceFactorReferenceRequest

Specify an instance family to use as the baseline reference for CPU performance. All instance types that match your specified attributes will be compared against the CPU performance of the referenced instance family, regardless of CPU manufacturer or architecture.

> **Note**
>
> Currently, only one instance family can be specified in the list.

## Contents

### InstanceFamily

The instance family to use as a baseline reference.

> **Note**
>
> Ensure that you specify the correct value for the instance family. The instance family is everything before the period (`.`) in the instance type name. For example, in the instance type `c6i.large`, the instance family is `c6i`, not `c6`. For more information, see Amazon EC2 instance type naming conventions in *Amazon EC2 Instance Types*.

The following instance families are *not supported* for performance protection:

- `c1`
- `g3 | g3s`
- `hpc7g`
- `m1 | m2`
- `mac1 | mac2 | mac2-m1ultra | mac2-m2 | mac2-m2pro`
- `p3dn | p4d | p5`
- `t1`
- `u-12tb1 | u-18tb1 | u-24tb1 | u-3tb1 | u-6tb1 | u-9tb1 | u7i-12tb | u7in-16tb | u7in-24tb | u7in-32tb`

If you enable performance protection by specifying a supported instance family, the returned instance types will exclude the above unsupported instance families.

If you specify an unsupported instance family as a value for baseline performance, the API returns an empty response for GetInstanceTypesFromInstanceRequirements and an exception for CreateFleet, RequestSpotFleet, ModifyFleet, and ModifySpotFleetRequest.

Type: String

Required: No

# Phase1DHGroupNumbersListValue

The Diffie-Hellmann group number for phase 1 IKE negotiations.

## Contents

**value**

The Diffie-Hellmann group number.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Phase1DHGroupNumbersRequestListValue

Specifies a Diffie-Hellman group number for the VPN tunnel for phase 1 IKE negotiations.

## Contents

### Value

The Diffie-Hellmann group number.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Phase1EncryptionAlgorithmsListValue

The encryption algorithm for phase 1 IKE negotiations.

## Contents

**value**

The value for the encryption algorithm.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

# Placement

Describes the placement of an instance.

## Contents

**Affinity** (request), **affinity** (response)

The affinity setting for the instance on the Dedicated Host.

This parameter is not supported for CreateFleet or ImportInstance.

Type: String

Required: No

**AvailabilityZone** (request), **availabilityZone** (response)

The Availability Zone of the instance.

On input, you can specify `AvailabilityZone` or `AvailabilityZoneId`, but not both. If you specify neither one, Amazon EC2 automatically selects an Availability Zone for you.

This parameter is not supported for CreateFleet.

Type: String

Required: No

**AvailabilityZoneId** (request), **availabilityZoneId** (response)

The ID of the Availability Zone of the instance.

On input, you can specify `AvailabilityZone` or `AvailabilityZoneId`, but not both. If you specify neither one, Amazon EC2 automatically selects an Availability Zone for you.

This parameter is not supported for CreateFleet.

Type: String

Required: No

**GroupId** (request), **groupId** (response)

The ID of the placement group that the instance is in.

On input, you can specify `GroupId` or `GroupName`, but not both.

Type: String

Required: No

**GroupName** (request), **groupName** (response)

The name of the placement group that the instance is in.

On input, you can specify `GroupId` or `GroupName`, but not both.

Type: String

Required: No

**HostId** (request), **hostId** (response)

The ID of the Dedicated Host on which the instance resides.

This parameter is not supported for CreateFleet or ImportInstance.

Type: String

Required: No

**HostResourceGroupArn** (request), **hostResourceGroupArn** (response)

The ARN of the host resource group in which to launch the instances.

On input, if you specify this parameter, either omit the **Tenancy** parameter or set it to `host`.

This parameter is not supported for CreateFleet.

Type: String

Required: No

**PartitionNumber** (request), **partitionNumber** (response)

The number of the partition that the instance is in. Valid only if the placement group strategy is set to `partition`.

This parameter is not supported for CreateFleet.

Type: Integer

Required: No

**SpreadDomain** (request), **spreadDomain** (response)

Reserved for future use.

Type: String

Required: No

**Tenancy** (request), **tenancy** (response)

The tenancy of the instance. An instance with a tenancy of `dedicated` runs on single-tenant hardware.

This parameter is not supported for CreateFleet. The `host` tenancy is not supported for ImportInstance or for T3 instances that are configured for the `unlimited` CPU credit option.

Type: String

Valid Values: `default | dedicated | host`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PlacementGroup

Describes a placement group.

## Contents

**groupArn**

The Amazon Resource Name (ARN) of the placement group.

Type: String

Required: No

**groupId**

The ID of the placement group.

Type: String

Required: No

**groupName**

The name of the placement group.

Type: String

Required: No

**linkedGroupId**

Reserved for future use.

Type: String

Required: No

**operator**

The service provider that manages the Placement Group.

Type: OperatorResponse object

Required: No

**partitionCount**

The number of partitions. Valid only if **strategy** is set to `partition`.

Type: Integer

Required: No

**spreadLevel**

The spread level for the placement group. *Only* Outpost placement groups can be spread across hosts.

Type: String

Valid Values: `host | rack`

Required: No

**state**

The state of the placement group.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**strategy**

The placement strategy.

Type: String

Valid Values: `cluster | spread | partition`

Required: No

**TagSet.N**

Any tags applied to the placement group.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PlacementGroupInfo

Describes the placement group support of the instance type.

## Contents

**SupportedStrategies.N**

The supported placement group types.

Type: Array of strings

Valid Values: `cluster | partition | spread`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PlacementResponse

Describes the placement of an instance.

## Contents

**groupName**

The name of the placement group that the instance is in.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PoolCidrBlock

Describes a CIDR block for an address pool.

## Contents

**poolCidrBlock**

The CIDR block.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PortRange

Describes a range of ports.

## Contents

**From** (request), **from** (response)

The first port in the range.

Type: Integer

Required: No

**To** (request), **to** (response)

The last port in the range.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrefixList

Describes prefixes for AWS services.

## Contents

**CidrSet.N**

The IP address range of the AWS service.

Type: Array of strings

Required: No

**prefixListId**

The ID of the prefix.

Type: String

Required: No

**prefixListName**

The name of the prefix.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrefixListAssociation

Describes the resource with which a prefix list is associated.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceOwner**

The owner of the resource.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrefixListEntry

Describes a prefix list entry.

## Contents

**cidr**

The CIDR block.

Type: String

Required: No

**description**

The description.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrefixListId

Describes a prefix list ID.

## Contents

**Description** (request), **description** (response)

A description for the security group rule that references this prefix list ID.

Constraints: Up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and ._-:/()#,@[]+=;{}!$*

Type: String

Required: No

**PrefixListId** (request), **prefixListId** (response)

The ID of the prefix.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PriceSchedule

Describes the price for a Reserved Instance.

## Contents

**active**

The current price schedule, as determined by the term remaining for the Reserved Instance in the listing.

A specific price schedule is always in effect, but only one price schedule can be active at any time. Take, for example, a Reserved Instance listing that has five months remaining in its term. When you specify price schedules for five months and two months, this means that schedule 1, covering the first three months of the remaining term, will be active during months 5, 4, and 3. Then schedule 2, covering the last two months of the term, will be active for months 2 and 1.

Type: Boolean

Required: No

**currencyCode**

The currency for transacting the Reserved Instance resale. At this time, the only supported currency is USD.

Type: String

Valid Values: USD

Required: No

**price**

The fixed price for the term.

Type: Double

Required: No

**term**

The number of months remaining in the reservation. For example, 2 is the second to the last month before the capacity reservation expires.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PriceScheduleSpecification

Describes the price for a Reserved Instance.

## Contents

**CurrencyCode**

The currency for transacting the Reserved Instance resale. At this time, the only supported currency is USD.

Type: String

Valid Values: USD

Required: No

**Price**

The fixed price for the term.

Type: Double

Required: No

**Term**

The number of months remaining in the reservation. For example, 2 is the second to the last month before the capacity reservation expires.

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PricingDetail

Describes a Reserved Instance offering.

## Contents

**count**

The number of reservations available for the price.

Type: Integer

Required: No

**price**

The price per instance.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrincipalIdFormat

PrincipalIdFormat description

## Contents

**arn**

PrincipalIdFormatARN description

Type: String

Required: No

**StatusSet.N**

PrincipalIdFormatStatuses description

Type: Array of IdFormat objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrivateDnsDetails

Information about the Private DNS name for interface endpoints.

## Contents

**privateDnsName**

The private DNS name assigned to the VPC endpoint service.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrivateDnsNameConfiguration

Information about the private DNS name for the service endpoint.

## Contents

**name**

The name of the record subdomain the service provider needs to create. The service provider adds the `value` text to the `name`.

Type: String

Required: No

**state**

The verification state of the VPC endpoint service.

Consumers of the endpoint service can use the private name only when the state is `verified`.

Type: String

Valid Values: `pendingVerification | verified | failed`

Required: No

**type**

The endpoint service verification type, for example TXT.

Type: String

Required: No

**value**

The value the service provider adds to the private DNS name domain record before verification.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrivateDnsNameOptionsOnLaunch

Describes the options for instance hostnames.

## Contents

**enableResourceNameDnsAAAARecord**

Indicates whether to respond to DNS queries for instance hostname with DNS AAAA records.

Type: Boolean

Required: No

**enableResourceNameDnsARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS A records.

Type: Boolean

Required: No

**hostnameType**

The type of hostname for EC2 instances. For IPv4 only subnets, an instance DNS name must be based on the instance IPv4 address. For IPv6 only subnets, an instance DNS name must be based on the instance ID. For dual-stack subnets, you can specify whether DNS names use the instance IPv4 address or the instance ID.

Type: String

Valid Values: `ip-name | resource-name`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# PrivateDnsNameOptionsRequest

Describes the options for instance hostnames.

## Contents

**EnableResourceNameDnsAAAARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS AAAA records.

Type: Boolean

Required: No

**EnableResourceNameDnsARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS A records.

Type: Boolean

Required: No

**HostnameType**

The type of hostname for EC2 instances. For IPv4 only subnets, an instance DNS name must be based on the instance IPv4 address. For IPv6 only subnets, an instance DNS name must be based on the instance ID. For dual-stack subnets, you can specify whether DNS names use the instance IPv4 address or the instance ID.

Type: String

Valid Values: `ip-name | resource-name`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# PrivateDnsNameOptionsResponse

Describes the options for instance hostnames.

## Contents

**enableResourceNameDnsAAAARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS AAAA records.

Type: Boolean

Required: No

**enableResourceNameDnsARecord**

Indicates whether to respond to DNS queries for instance hostnames with DNS A records.

Type: Boolean

Required: No

**hostnameType**

The type of hostname to assign to an instance.

Type: String

Valid Values: `ip-name | resource-name`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PrivateIpAddressSpecification

Describes a secondary private IPv4 address for a network interface.

## Contents

**Primary** (request), **primary** (response)

Indicates whether the private IPv4 address is the primary private IPv4 address. Only one IPv4 address can be designated as primary.

Type: Boolean

Required: No

**PrivateIpAddress** (request), **privateIpAddress** (response)

The private IPv4 address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ProcessorInfo

Describes the processor used by the instance type.

## Contents

**manufacturer**

The manufacturer of the processor.

Type: String

Required: No

**SupportedArchitectures.N**

The architectures supported by the instance type.

Type: Array of strings

Valid Values: `i386 | x86_64 | arm64 | x86_64_mac | arm64_mac`

Required: No

**SupportedFeatures.N**

Indicates whether the instance type supports AMD SEV-SNP. If the request returns `amd-sev-snp`, AMD SEV-SNP is supported. Otherwise, it is not supported. For more information, see AMD SEV-SNP.

Type: Array of strings

Valid Values: `amd-sev-snp | nested-virtualization`

Required: No

**sustainedClockSpeedInGhz**

The speed of the processor, in GHz.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ProductCode

Describes a product code.

## Contents

**productCode**

The product code.

Type: String

Required: No

**type**

The type of product code.

Type: String

Valid Values: `devpay | marketplace`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PropagatingVgw

Describes a virtual private gateway propagating route.

## Contents

**gatewayId**

The ID of the virtual private gateway.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ProvisionedBandwidth

Reserved. If you need to sustain traffic greater than the documented limits, contact AWS Support.

## Contents

**provisioned**

Reserved.

Type: String

Required: No

**provisionTime**

Reserved.

Type: Timestamp

Required: No

**requested**

Reserved.

Type: String

Required: No

**requestTime**

Reserved.

Type: Timestamp

Required: No

**status**

Reserved.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PtrUpdateStatus

The status of an updated pointer (PTR) record for an Elastic IP address.

## Contents

**reason**

The reason for the PTR record update.

Type: String

Required: No

**status**

The status of the PTR record update.

Type: String

Required: No

**value**

The value for the PTR record update.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PublicIpDnsNameOptions

Public hostname type options. For more information, see EC2 instance hostnames, DNS names, and domains in the *Amazon EC2 User Guide*.

## Contents

**dnsHostnameType**

The public hostname type. For more information, see EC2 instance hostnames, DNS names, and domains in the *Amazon EC2 User Guide*.

Type: String

Required: No

**publicDualStackDnsName**

A dual-stack public hostname for a network interface. Requests from within the VPC resolve to both the private IPv4 address and the IPv6 Global Unicast Address of the network interface. Requests from the internet resolve to both the public IPv4 and the IPv6 GUA address of the network interface.

Type: String

Required: No

**publicIpv4DnsName**

An IPv4-enabled public hostname for a network interface. Requests from within the VPC resolve to the private primary IPv4 address of the network interface. Requests from the internet resolve to the public IPv4 address of the network interface.

Type: String

Required: No

**publicIpv6DnsName**

An IPv6-enabled public hostname for a network interface. Requests from within the VPC or from the internet resolve to the IPv6 GUA of the network interface.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PublicIpv4Pool

Describes an IPv4 address pool.

## Contents

**description**

A description of the address pool.

Type: String

Required: No

**networkBorderGroup**

The name of the location from which the address pool is advertised. A network border group is a unique set of Availability Zones or Local Zones from where AWS advertises public IP addresses.

Type: String

Required: No

**PoolAddressRangeSet.N**

The address ranges.

Type: Array of PublicIpv4PoolRange objects

Required: No

**poolId**

The ID of the address pool.

Type: String

Required: No

**TagSet.N**

Any tags for the address pool.

Type: Array of Tag objects

Required: No

**totalAddressCount**

The total number of addresses.

Type: Integer

Required: No

**totalAvailableAddressCount**

The total number of available addresses.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PublicIpv4PoolRange

Describes an address range of an IPv4 address pool.

## Contents

**addressCount**

The number of addresses in the range.

Type: Integer

Required: No

**availableAddressCount**

The number of available addresses in the range.

Type: Integer

Required: No

**firstAddress**

The first IP address in the range.

Type: String

Required: No

**lastAddress**

The last IP address in the range.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Purchase

Describes the result of the purchase.

## Contents

**currencyCode**

The currency in which the `UpfrontPrice` and `HourlyPrice` amounts are specified. At this time, the only supported currency is `USD`.

Type: String

Valid Values: USD

Required: No

**duration**

The duration of the reservation's term in seconds.

Type: Integer

Required: No

**HostIdSet.N**

The IDs of the Dedicated Hosts associated with the reservation.

Type: Array of strings

Required: No

**hostReservationId**

The ID of the reservation.

Type: String

Required: No

**hourlyPrice**

The hourly price of the reservation per hour.

Type: String

Required: No

**instanceFamily**

The instance family on the Dedicated Host that the reservation can be associated with.

Type: String

Required: No

**paymentOption**

The payment option for the reservation.

Type: String

Valid Values: `AllUpfront | PartialUpfront | NoUpfront`

Required: No

**upfrontPrice**

The upfront price of the reservation.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# PurchaseRequest

Describes a request to purchase Scheduled Instances.

## Contents

**InstanceCount**

The number of instances.

Type: Integer

Required: Yes

**PurchaseToken**

The purchase token.

Type: String

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RecurringCharge

Describes a recurring charge.

## Contents

**amount**

The amount of the recurring charge.

Type: Double

Required: No

**frequency**

The frequency of the recurring charge.

Type: String

Valid Values: `Hourly`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReferencedSecurityGroup

Describes the security group that is referenced in the security group rule.

## Contents

**groupId**

The ID of the security group.

Type: String

Required: No

**peeringStatus**

The status of a VPC peering connection, if applicable.

Type: String

Required: No

**userId**

The AWS account ID.

Type: String

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

**vpcPeeringConnectionId**

The ID of the VPC peering connection (if applicable).

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Region

Describes a Region.

## Contents

**GeographySet.N**

The geography information for the Region. The geography is returned as a list.

Type: Array of RegionGeography objects

Required: No

**optInStatus**

The Region opt-in status. The possible values are `opt-in-not-required`, `opted-in`, and `not-opted-in`.

Type: String

Required: No

**regionEndpoint**

The Region service endpoint.

Type: String

Required: No

**regionName**

The name of the Region.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RegionalSummary

A summary report for the attribute for a Region.

## Contents

**numberOfMatchedAccounts**

The number of accounts in the Region with the same configuration value for the attribute that is most frequently observed.

Type: Integer

Required: No

**numberOfUnmatchedAccounts**

The number of accounts in the Region with a configuration value different from the most frequently observed value for the attribute.

Type: Integer

Required: No

**regionName**

The AWS Region.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RegionGeography

Describes the geography information for a Region.

## Contents

**name**

The name of the geography, for example, `United States of America`.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RegisteredInstance

Describes an Amazon EC2 instance that is enabled for SQL Server High Availability standby detection monitoring.

## Contents

**haStatus**

The SQL Server High Availability status of the instance. Valid values are:

- `processing` - The SQL Server High Availability status for the SQL Server High Availability instance is being updated.
- `active` - The SQL Server High Availability instance is an active node in an SQL Server High Availability cluster.
- `standby` - The SQL Server High Availability instance is a standby failover node in an SQL Server High Availability cluster.
- `invalid` - An error occurred due to misconfigured permissions, or unable to dertemine SQL Server High Availability status for the SQL Server High Availability instance.

Type: String

Valid Values: `processing | active | standby | invalid`

Required: No

**instanceId**

The ID of the SQL Server High Availability instance.

Type: String

Required: No

**lastUpdatedTime**

The date and time when the instance's SQL Server High Availability status was last updated, in the ISO 8601 format in the UTC time zone (`YYYY-MM-DDThh:mm:ss.sssZ`).

Type: Timestamp

Required: No

**processingStatus**

A brief description of the SQL Server High Availability status. If the instance is in the `invalid` High Availability status, this parameter includes the error message.

Type: String

Required: No

**sqlServerCredentials**

The ARN of the AWS Secrets Manager secret containing the SQL Server access credentials for the SQL Server High Availability instance. If not specified, deafult local user credentials will be used by the AWS Systems Manager agent.

Type: String

Required: No

**sqlServerLicenseUsage**

The license type for the SQL Server license. Valid values include:

- `full` - The SQL Server High Availability instance is using a full SQL Server license.
- `waived` - The SQL Server High Availability instance is waived from the SQL Server license.

Type: String

Valid Values: `full | waived`

Required: No

**TagSet.N**

The tags assigned to the SQL Server High Availability instance.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RegisterInstanceTagAttributeRequest

Information about the tag keys to register for the current Region. You can either specify individual tag keys or register all tag keys in the current Region. You must specify either `IncludeAllTagsOfInstance` or `InstanceTagKeys` in the request

## Contents

**IncludeAllTagsOfInstance**

Indicates whether to register all tag keys in the current Region. Specify `true` to register all tag keys.

Type: Boolean

Required: No

**InstanceTagKey.N**

The tag keys to register.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RemoveIpamOperatingRegion

Remove an operating Region from an IPAM. Operating Regions are AWS Regions where the IPAM is allowed to manage IP address CIDRs. IPAM only discovers and monitors resources in the AWS Regions you select as operating Regions.

For more information about operating Regions, see Create an IPAM in the *Amazon VPC IPAM User Guide*

## Contents

**RegionName**

The name of the operating Region you want to remove.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RemoveIpamOrganizationalUnitExclusion

Remove an Organizational Unit (OU) exclusion to your IPAM. If your IPAM is integrated with AWS Organizations and you add an organizational unit (OU) exclusion, IPAM will not manage the IP addresses in accounts in that OU exclusion. There is a limit on the number of exclusions you can create. For more information, see Quotas for your IPAM in the *Amazon VPC IPAM User Guide*.

## Contents

**OrganizationsEntityPath**

An AWS Organizations entity path. Build the path for the OU(s) using AWS Organizations IDs separated by a `/`. Include all child OUs by ending the path with `/*`.

- Example 1
  - Path to a child OU: `o-a1b2c3d4e5/r-f6g7h8i9j0example/ou-ghi0-awsccccc/ou-jkl0-awsddddd/`
  - In this example, `o-a1b2c3d4e5` is the organization ID, `r-f6g7h8i9j0example` is the root ID , `ou-ghi0-awsccccc` is an OU ID, and `ou-jkl0-awsddddd` is a child OU ID.
  - IPAM will not manage the IP addresses in accounts in the child OU.
- Example 2
  - Path where all child OUs will be part of the exclusion: `o-a1b2c3d4e5/r-f6g7h8i9j0example/ou-ghi0-awsccccc/*`
  - In this example, IPAM will not manage the IP addresses in accounts in the OU (`ou-ghi0-awsccccc`) or in accounts in any OUs that are children of the OU.

For more information on how to construct an entity path, see Understand the AWS Organizations entity path in the *AWS Identity and Access Management User Guide*.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RemovePrefixListEntry

An entry for a prefix list.

## Contents

### Cidr

The CIDR block.

Type: String

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReplaceRootVolumeTask

Information about a root volume replacement task.

## Contents

**completeTime**

The time the task completed.

Type: String

Required: No

**deleteReplacedRootVolume**

Indicates whether the original root volume is to be deleted after the root volume replacement task completes.

Type: Boolean

Required: No

**imageId**

The ID of the AMI used to create the replacement root volume.

Type: String

Required: No

**instanceId**

The ID of the instance for which the root volume replacement task was created.

Type: String

Required: No

**replaceRootVolumeTaskId**

The ID of the root volume replacement task.

Type: String

Required: No

**snapshotId**

The ID of the snapshot used to create the replacement root volume.

Type: String

Required: No

**startTime**

The time the task was started.

Type: String

Required: No

**TagSet.N**

The tags assigned to the task.

Type: Array of Tag objects

Required: No

**taskState**

The state of the task. The task can be in one of the following states:

- `pending` - the replacement volume is being created.
- `in-progress` - the original volume is being detached and the replacement volume is being attached.
- `succeeded` - the replacement volume has been successfully attached to the instance and the instance is available.
- `failing` - the replacement task is in the process of failing.
- `failed` - the replacement task has failed but the original root volume is still attached.
- `failing-detached` - the replacement task is in the process of failing. The instance might have no root volume attached.
- `failed-detached` - the replacement task has failed and the instance has no root volume attached.

Type: String

Valid Values: `pending | in-progress | failing | succeeded | failed | failed-detached`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RequestFilterPortRange

Describes a port range.

## Contents

**FromPort**

The first port in the range.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

**ToPort**

The last port in the range.

Type: Integer

Valid Range: Minimum value of 0. Maximum value of 65535.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RequestIpamResourceTag

A tag on an IPAM resource.

## Contents

**Key**

The key of a tag assigned to the resource. Use this filter to find all resources assigned a tag with a specific key, regardless of the tag value.

Type: String

Required: No

**Value**

The value for the tag.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RequestLaunchTemplateData

The information to include in the launch template.

> **Note**
>
> You must specify at least one parameter for the launch template data.

## Contents

**BlockDeviceMapping.N**

The block device mapping.

Type: Array of LaunchTemplateBlockDeviceMappingRequest objects

Required: No

**CapacityReservationSpecification**

The Capacity Reservation targeting option. If you do not specify this parameter, the instance's Capacity Reservation preference defaults to open, which enables it to run in any open Capacity Reservation that has matching attributes (instance type, platform, Availability Zone).

Type: LaunchTemplateCapacityReservationSpecificationRequest object

Required: No

**CpuOptions**

The CPU options for the instance. For more information, see CPU options for Amazon EC2 instances in the *Amazon EC2 User Guide*.

Type: LaunchTemplateCpuOptionsRequest object

Required: No

**CreditSpecification**

The credit option for CPU usage of the instance. Valid only for T instances.

Type: CreditSpecificationRequest object

Required: No

**DisableApiStop**

Indicates whether to enable the instance for stop protection. For more information, see Enable stop protection for your EC2 instances in the *Amazon EC2 User Guide*.

Type: Boolean

Required: No

**DisableApiTermination**

Indicates whether termination protection is enabled for the instance. The default is `false`, which means that you can terminate the instance using the Amazon EC2 console, command line tools, or API. You can enable termination protection when you launch an instance, while the instance is running, or while the instance is stopped.

Type: Boolean

Required: No

**EbsOptimized**

Indicates whether the instance is optimized for Amazon EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal Amazon EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

Type: Boolean

Required: No

**ElasticGpuSpecification.N**

Deprecated.

> **Note**
>
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Type: Array of ElasticGpuSpecification objects

Required: No

**ElasticInferenceAccelerator.N**

*This member has been deprecated.*

> **Note**
>
> Amazon Elastic Inference is no longer available.

An elastic inference accelerator to associate with the instance. Elastic inference accelerators are a resource you can attach to your Amazon EC2 instances to accelerate your Deep Learning (DL) inference workloads.

You cannot specify accelerators from different generations in the same request.

Type: Array of LaunchTemplateElasticInferenceAccelerator objects

Required: No

**EnclaveOptions**

Indicates whether the instance is enabled for AWS Nitro Enclaves. For more information, see What is Nitro Enclaves? in the *AWS Nitro Enclaves User Guide*.

You can't enable AWS Nitro Enclaves and hibernation on the same instance.

Type: LaunchTemplateEnclaveOptionsRequest object

Required: No

**HibernationOptions**

Indicates whether an instance is enabled for hibernation. This parameter is valid only if the instance meets the hibernation prerequisites. For more information, see Hibernate your Amazon EC2 instance in the *Amazon EC2 User Guide*.

Type: LaunchTemplateHibernationOptionsRequest object

Required: No

**IamInstanceProfile**

The name or Amazon Resource Name (ARN) of an IAM instance profile.

Type: LaunchTemplateIamInstanceProfileSpecificationRequest object

Required: No

**ImageId**

The ID of the AMI in the format `ami-0ac394d6a3example`.

Alternatively, you can specify a Systems Manager parameter, using one of the following formats. The Systems Manager parameter will resolve to an AMI ID on launch.

To reference a public parameter:

- `resolve:ssm:public-parameter`

To reference a parameter stored in the same account:

- `resolve:ssm:parameter-name`
- `resolve:ssm:parameter-name:version-number`
- `resolve:ssm:parameter-name:label`

To reference a parameter shared from another AWS account:

- `resolve:ssm:parameter-ARN`
- `resolve:ssm:parameter-ARN:version-number`
- `resolve:ssm:parameter-ARN:label`

For more information, see Use a Systems Manager parameter instead of an AMI ID in the *Amazon EC2 User Guide*.

> **Note**
>
> If the launch template will be used for an EC2 Fleet or Spot Fleet, note the following:
>
> - Only EC2 Fleets of type `instant` support specifying a Systems Manager parameter.
> - For EC2 Fleets of type `maintain` or `request`, or for Spot Fleets, you must specify the AMI ID.

Type: String

Required: No

**InstanceInitiatedShutdownBehavior**

Indicates whether an instance stops or terminates when you initiate shutdown from the instance (using the operating system command for system shutdown).

Default: `stop`

Type: String

Valid Values: `stop | terminate`

Required: No

**InstanceMarketOptions**

The market (purchasing) option for the instances.

Type: LaunchTemplateInstanceMarketOptionsRequest object

Required: No

**InstanceRequirements**

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with these attributes.

You must specify `VCpuCount` and `MemoryMiB`. All other attributes are optional. Any unspecified optional attribute is set to its default.

When you specify multiple attributes, you get instance types that satisfy all of the specified attributes. If you specify multiple values for an attribute, you get instance types that satisfy any of the specified values.

To limit the list of instance types from which Amazon EC2 can identify matching instance types, you can use one of the following parameters, but not both in the same request:

- `AllowedInstanceTypes` - The instance types to include in the list. All other instance types are ignored, even if they match your specified attributes.
- `ExcludedInstanceTypes` - The instance types to exclude from the list, even if they match your specified attributes.

> **Note**
>
> If you specify `InstanceRequirements`, you can't specify `InstanceType`.

> Attribute-based instance type selection is only supported when using Auto Scaling groups, EC2 Fleet, and Spot Fleet to launch instances. If you plan to use the launch template in the launch instance wizard, or with the RunInstances API or AWS::EC2::Instance AWS CloudFormation resource, you can't specify `InstanceRequirements`.

For more information, see Specify attributes for instance type selection for EC2 Fleet or Spot Fleet and Spot placement score in the *Amazon EC2 User Guide*.

Type: InstanceRequirementsRequest object

Required: No

**InstanceType**

The instance type. For more information, see Amazon EC2 instance types in the *Amazon EC2 User Guide*.

If you specify `InstanceType`, you can't specify `InstanceRequirements`.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge |`

```

Required: No

**KernelId**

The ID of the kernel.

> **Important**
>
> We recommend that you use PV-GRUB instead of kernels and RAM disks. For more information, see User provided kernels in the *Amazon Linux 2 User Guide*.

Type: String

Required: No

**KeyName**

The name of the key pair. You can create a key pair using CreateKeyPair or ImportKeyPair.

> **Important**
>
> If you do not specify a key pair, you can't connect to the instance unless you choose an AMI that is configured to allow users another way to log in.

Type: String

Required: No

**LicenseSpecification.N**

The license configurations.

Type: Array of LaunchTemplateLicenseConfigurationRequest objects

Required: No

**MaintenanceOptions**

The maintenance options for the instance.

Type: LaunchTemplateInstanceMaintenanceOptionsRequest object

Required: No

**MetadataOptions**

The metadata options for the instance. For more information, see Configure the Instance Metadata Service options in the *Amazon EC2 User Guide*.

Type: LaunchTemplateInstanceMetadataOptionsRequest object

Required: No

**Monitoring**

The monitoring for the instance.

Type: LaunchTemplatesMonitoringRequest object

Required: No

**NetworkInterface.N**

The network interfaces for the instance.

Type: Array of LaunchTemplateInstanceNetworkInterfaceSpecificationRequest objects

Required: No

**NetworkPerformanceOptions**

Contains launch template settings to boost network performance for the type of workload that runs on your instance.

Type: LaunchTemplateNetworkPerformanceOptionsRequest object

Required: No

**Operator**

The entity that manages the launch template.

Type: OperatorRequest object

Required: No

**Placement**

The placement for the instance.

Type: LaunchTemplatePlacementRequest object

Required: No

**PrivateDnsNameOptions**

The options for the instance hostname. The default values are inherited from the subnet.

Type: LaunchTemplatePrivateDnsNameOptionsRequest object

Required: No

**RamDiskId**

The ID of the RAM disk.

> **Important**
>
> We recommend that you use PV-GRUB instead of kernels and RAM disks. For more information, see User provided kernels in the *Amazon EC2 User Guide*.

Type: String

Required: No

**SecondaryInterface.N**

The secondary interfaces to associate with instances launched from the template.

Type: Array of LaunchTemplateInstanceSecondaryInterfaceSpecificationRequest objects

Required: No

**SecurityGroup.N**

The names of the security groups. For a nondefault VPC, you must use security group IDs instead.

If you specify a network interface, you must specify any security groups as part of the network interface instead of using this parameter.

Type: Array of strings

Required: No

**SecurityGroupId.N**

The IDs of the security groups.

If you specify a network interface, you must specify any security groups as part of the network interface instead of using this parameter.

Type: Array of strings

Required: No

**TagSpecification.N**

The tags to apply to the resources that are created during instance launch. These tags are not applied to the launch template.

Type: Array of LaunchTemplateTagSpecificationRequest objects

Required: No

**UserData**

The user data to make available to the instance. You must provide base64-encoded text. User data is limited to 16 KB. For more information, see Run commands when you launch an EC2 instance with user data input in the *Amazon EC2 User Guide*.

If you are creating the launch template for use with AWS Batch, the user data must be provided in the MIME multi-part archive format. For more information, see Amazon EC2 user data in launch templates in the *AWS Batch User Guide*.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RequestSpotLaunchSpecification

Describes the launch specification for an instance.

## Contents

**AddressingType**

Deprecated.

Type: String

Required: No

**BlockDeviceMapping.N**

The block device mapping entries. You can't specify both a snapshot ID and an encryption value. This is because only blank volumes can be encrypted on creation. If a snapshot is the basis for a volume, it is not blank and its encryption status is used for the volume encryption status.

Type: Array of BlockDeviceMapping objects

Required: No

**EbsOptimized**

Indicates whether the instance is optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS Optimized instance.

Default: `false`

Type: Boolean

Required: No

**IamInstanceProfile**

The IAM instance profile.

Type: IamInstanceProfileSpecification object

Required: No

**ImageId**

The ID of the AMI.

Type: String

Required: No

**InstanceType**

The instance type. Only one instance type can be specified.

Type: String

Required: No

**KernelId**

The ID of the kernel.

Type: String

Required: No

**KeyName**

The name of the key pair.

Type: String

Required: No

**Monitoring**

Indicates whether basic or detailed monitoring is enabled for the instance.

Default: Disabled

Type: RunInstancesMonitoringEnabled object

Required: No

**NetworkInterface.N**

The network interfaces. If you specify a network interface, you must specify subnet IDs and security group IDs using the network interface.

Type: Array of InstanceNetworkInterfaceSpecification objects

Required: No

**Placement**

The placement information for the instance.

Type: SpotPlacement object

Required: No

**RamdiskId**

The ID of the RAM disk.

Type: String

Required: No

**SecurityGroup.N**

Not supported.

Type: Array of strings

Required: No

**SecurityGroupId.N**

The IDs of the security groups.

Type: Array of strings

Required: No

**SubnetId**

The ID of the subnet in which to launch the instance.

Type: String

Required: No

**UserData**

The base64-encoded user data that instances use when starting up. User data is limited to 16 KB.

Type: String

Required: No

## See Also

- AWS SDK for Ruby V3

# Reservation

Describes a launch request for one or more instances, and includes owner, requester, and security group information that applies to all instances in the launch request.

## Contents

**GroupSet.N**

Not supported.

Type: Array of GroupIdentifier objects

Required: No

**InstancesSet.N**

The instances.

Type: Array of Instance objects

Required: No

**ownerId**

The ID of the AWS account that owns the reservation.

Type: String

Required: No

**requesterId**

The ID of the requester that launched the instances on your behalf (for example, AWS Management Console or Auto Scaling).

Type: String

Required: No

**reservationId**

The ID of the reservation.

Type: String

Required: No

## See Also

# ReservationFleetInstanceSpecification

Information about an instance type to use in a Capacity Reservation Fleet.

## Contents

**AvailabilityZone**

The Availability Zone in which the Capacity Reservation Fleet reserves the capacity. A Capacity Reservation Fleet can't span Availability Zones. All instance type specifications that you specify for the Fleet must use the same Availability Zone.

Type: String

Required: No

**AvailabilityZoneId**

The ID of the Availability Zone in which the Capacity Reservation Fleet reserves the capacity. A Capacity Reservation Fleet can't span Availability Zones. All instance type specifications that you specify for the Fleet must use the same Availability Zone.

Type: String

Required: No

**EbsOptimized**

Indicates whether the Capacity Reservation Fleet supports EBS-optimized instances types. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using EBS-optimized instance types.

Type: Boolean

Required: No

**InstancePlatform**

The type of operating system for which the Capacity Reservation Fleet reserves capacity.

Type: String

Valid Values: `Linux/UNIX | Red Hat Enterprise Linux | SUSE Linux | Windows | Windows with SQL Server | Windows with SQL Server Enterprise | Windows`

with SQL Server Standard | Windows with SQL Server Web | Linux with SQL Server Standard | Linux with SQL Server Web | Linux with SQL Server Enterprise | RHEL with SQL Server Standard | RHEL with SQL Server Enterprise | RHEL with SQL Server Web | RHEL with HA | RHEL with HA and SQL Server Standard | RHEL with HA and SQL Server Enterprise | Ubuntu Pro

Required: No

**InstanceType**

The instance type for which the Capacity Reservation Fleet reserves capacity.

Type: String

Valid Values: a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge

```

Required: No

**Priority**

The priority to assign to the instance type. This value is used to determine which of the instance types specified for the Fleet should be prioritized for use. A lower value indicates a high priority. For more information, see Instance type priority in the *Amazon EC2 User Guide*.

Type: Integer

Valid Range: Minimum value of 0.

Required: No

**Weight**

The number of capacity units provided by the specified instance type. This value, together with the total target capacity that you specify for the Fleet determine the number of instances for which the Fleet reserves capacity. Both values are based on units that make sense for your workload. For more information, see Total target capacity in the *Amazon EC2 User Guide*.

Type: Double

Valid Range: Minimum value of 0.001. Maximum value of 99.999.

Required: No

## See Also

- AWS SDK for Ruby V3

# ReservationValue

The cost associated with the Reserved Instance.

## Contents

**hourlyPrice**

The hourly rate of the reservation.

Type: String

Required: No

**remainingTotalValue**

The balance of the total value (the sum of remainingUpfrontValue + hourlyPrice * number of hours remaining).

Type: String

Required: No

**remainingUpfrontValue**

The remaining upfront cost of the reservation.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedCapacityOptions

Defines EC2 Fleet preferences for utilizing reserved capacity when DefaultTargetCapacityType is set to `reserved-capacity`.

## Contents

**ReservationTypeSet.N**

The types of Capacity Reservations used for fulfilling the EC2 Fleet request.

Type: Array of strings

Valid Values: `interruptible-capacity-reservation`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedCapacityOptionsRequest

Defines EC2 Fleet preferences for utilizing reserved capacity when DefaultTargetCapacityType is set to `reserved-capacity`.

> **Note**
>
> This configuration can only be used if the EC2 Fleet is of type `instant`.

When you specify `ReservedCapacityOptions`, you must also set `DefaultTargetCapacityType` to `reserved-capacity` in the `TargetCapacitySpecification`.

For more information about Interruptible Capacity Reservations, see Launch instances into an Interruptible Capacity Reservation in the *Amazon EC2 User Guide*.

## Contents

**ReservationType.N**

The types of Capacity Reservations to use for fulfilling the EC2 Fleet request.

Type: Array of strings

Valid Values: `interruptible-capacity-reservation`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedInstanceLimitPrice

Describes the limit price of a Reserved Instance offering.

## Contents

**Amount**

Used for Reserved Instance Marketplace offerings. Specifies the limit price on the total order (instanceCount * price).

Type: Double

Required: No

**CurrencyCode**

The currency in which the `limitPrice` amount is specified. At this time, the only supported currency is USD.

Type: String

Valid Values: USD

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedInstanceReservationValue

The total value of the Convertible Reserved Instance.

## Contents

**reservationValue**

The total value of the Convertible Reserved Instance that you are exchanging.

Type: ReservationValue object

Required: No

**reservedInstanceId**

The ID of the Convertible Reserved Instance that you are exchanging.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedInstances

Describes a Reserved Instance.

## Contents

**availabilityZone**

The Availability Zone in which the Reserved Instance can be used.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**currencyCode**

The currency of the Reserved Instance. It's specified using ISO 4217 standard currency codes. At this time, the only supported currency is USD.

Type: String

Valid Values: USD

Required: No

**duration**

The duration of the Reserved Instance, in seconds.

Type: Long

Required: No

**end**

The time when the Reserved Instance expires.

Type: Timestamp

Required: No

**fixedPrice**

The purchase price of the Reserved Instance.

Type: Float

Required: No

**instanceCount**

The number of reservations purchased.

Type: Integer

Required: No

**instanceTenancy**

The tenancy of the instance.

Type: String

Valid Values: `default | dedicated | host`

Required: No

**instanceType**

The instance type on which the Reserved Instance can be used.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge`

Required: No

**offeringClass**

The offering class of the Reserved Instance.

Type: String

Valid Values: standard | convertible

Required: No

**offeringType**

The Reserved Instance offering type.

Type: String

Valid Values: Heavy Utilization | Medium Utilization | Light Utilization | No Upfront | Partial Upfront | All Upfront

Required: No

**productDescription**

The Reserved Instance product platform description.

Type: String

Valid Values: `Linux/UNIX | Linux/UNIX (Amazon VPC) | Windows | Windows (Amazon VPC)`

Required: No

**RecurringCharges.N**

The recurring charge tag assigned to the resource.

Type: Array of RecurringCharge objects

Required: No

**reservedInstancesId**

The ID of the Reserved Instance.

Type: String

Required: No

**scope**

The scope of the Reserved Instance.

Type: String

Valid Values: `Availability Zone | Region`

Required: No

**start**

The date and time the Reserved Instance started.

Type: Timestamp

Required: No

**state**

The state of the Reserved Instance purchase.

Type: String

Valid Values: `payment-pending | active | payment-failed | retired | queued | queued-deleted`

Required: No

**TagSet.N**

Any tags assigned to the resource.

Type: Array of Tag objects

Required: No

**usagePrice**

The usage price of the Reserved Instance, per hour.

Type: Float

Required: No

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedInstancesConfiguration

Describes the configuration settings for the modified Reserved Instances.

## Contents

**AvailabilityZone** (request), **availabilityZone** (response)

The Availability Zone for the modified Reserved Instances.

Type: String

Required: No

**AvailabilityZoneId** (request), **availabilityZoneId** (response)

The ID of the Availability Zone.

Type: String

Required: No

**InstanceCount** (request), **instanceCount** (response)

The number of modified Reserved Instances.

> **Note**
>
> This is a required field for a request.

Type: Integer

Required: No

**InstanceType** (request), **instanceType** (response)

The instance type for the modified Reserved Instances.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge`

Required: No

**Platform** (request), **platform** (response)

The network platform of the modified Reserved Instances.

Type: String

Required: No

**Scope** (request), **scope** (response)

Whether the Reserved Instance is applied to instances in a Region or instances in a specific Availability Zone.

Type: String

Valid Values: `Availability Zone | Region`

Required: No

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedInstancesId

Describes the ID of a Reserved Instance.

## Contents

**reservedInstancesId**

The ID of the Reserved Instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedInstancesListing

Describes a Reserved Instance listing.

## Contents

**clientToken**

A unique, case-sensitive key supplied by the client to ensure that the request is idempotent. For more information, see Ensuring Idempotency.

Type: String

Required: No

**createDate**

The time the listing was created.

Type: Timestamp

Required: No

**InstanceCounts.N**

The number of instances in this state.

Type: Array of InstanceCount objects

Required: No

**PriceSchedules.N**

The price of the Reserved Instance listing.

Type: Array of PriceSchedule objects

Required: No

**reservedInstancesId**

The ID of the Reserved Instance.

Type: String

Required: No

**reservedInstancesListingId**

The ID of the Reserved Instance listing.

Type: String

Required: No

**status**

The status of the Reserved Instance listing.

Type: String

Valid Values: `active | pending | cancelled | closed`

Required: No

**statusMessage**

The reason for the current status of the Reserved Instance listing. The response can be blank.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the resource.

Type: Array of Tag objects

Required: No

**updateDate**

The last modified timestamp of the listing.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedInstancesModification

Describes a Reserved Instance modification.

## Contents

**clientToken**

A unique, case-sensitive key supplied by the client to ensure that the request is idempotent. For more information, see Ensuring Idempotency.

Type: String

Required: No

**createDate**

The time when the modification request was created.

Type: Timestamp

Required: No

**effectiveDate**

The time for the modification to become effective.

Type: Timestamp

Required: No

**ModificationResultSet.N**

Contains target configurations along with their corresponding new Reserved Instance IDs.

Type: Array of ReservedInstancesModificationResult objects

Required: No

**reservedInstancesModificationId**

A unique ID for the Reserved Instance modification.

Type: String

Required: No

**ReservedInstancesSet.N**

The IDs of one or more Reserved Instances.

Type: Array of ReservedInstancesId objects

Required: No

**status**

The status of the Reserved Instances modification request.

Type: String

Required: No

**statusMessage**

The reason for the status.

Type: String

Required: No

**updateDate**

The time when the modification request was last updated.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ReservedInstancesModificationResult

Describes the modification request/s.

## Contents

**reservedInstancesId**

The ID for the Reserved Instances that were created as part of the modification request. This field is only available when the modification is fulfilled.

Type: String

Required: No

**targetConfiguration**

The target Reserved Instances configurations supplied as part of the modification request.

Type: ReservedInstancesConfiguration object

Required: No

## See Also

# ReservedInstancesOffering

Describes a Reserved Instance offering.

## Contents

**availabilityZone**

The Availability Zone in which the Reserved Instance can be used.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**currencyCode**

The currency of the Reserved Instance offering you are purchasing. It's specified using ISO 4217 standard currency codes. At this time, the only supported currency is USD.

Type: String

Valid Values: USD

Required: No

**duration**

The duration of the Reserved Instance, in seconds.

Type: Long

Required: No

**fixedPrice**

The purchase price of the Reserved Instance.

Type: Float

Required: No

**instanceTenancy**

The tenancy of the instance.

Type: String

Valid Values: `default | dedicated | host`

Required: No

**instanceType**

The instance type on which the Reserved Instance can be used.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge`

Required: No

**marketplace**

Indicates whether the offering is available through the Reserved Instance Marketplace (resale) or AWS. If it's a Reserved Instance Marketplace offering, this is `true`.

Type: Boolean

Required: No

**offeringClass**

If `convertible` it can be exchanged for Reserved Instances of the same or higher monetary value, with different configurations. If `standard`, it is not possible to perform an exchange.

Type: String

Valid Values: `standard | convertible`

Required: No

**offeringType**

The Reserved Instance offering type.

Type: String

Valid Values: `Heavy Utilization | Medium Utilization | Light Utilization | No Upfront | Partial Upfront | All Upfront`

Required: No

**PricingDetailsSet.N**

The pricing details of the Reserved Instance offering.

Type: Array of PricingDetail objects

Required: No

**productDescription**

The Reserved Instance product platform description.

Type: String

Valid Values: `Linux/UNIX | Linux/UNIX (Amazon VPC) | Windows | Windows (Amazon VPC)`

Required: No

**RecurringCharges.N**

The recurring charge tag assigned to the resource.

Type: Array of RecurringCharge objects

Required: No

**reservedInstancesOfferingId**

The ID of the Reserved Instance offering. This is the offering ID used in GetReservedInstancesExchangeQuote to confirm that an exchange can be made.

Type: String

Required: No

**scope**

Whether the Reserved Instance is applied to instances in a Region or an Availability Zone.

Type: String

Valid Values: `Availability Zone | Region`

Required: No

**usagePrice**

The usage price of the Reserved Instance, per hour.

Type: Float

Required: No

# ResourceStatement

Describes a resource statement.

## Contents

**ResourceSet.N**

The resources.

Type: Array of strings

Required: No

**ResourceTypeSet.N**

The resource types.

Type: Array of strings

Required: No

## See Also

# ResourceTypeOption

The options that affect the scope of the response.

## Contents

**OptionName**

The name of the option.

- For `ec2:Instance`:

  Specify `state-name` - The current state of the EC2 instance.

- For `ec2:LaunchTemplate`:

  Specify `version-depth` - The number of launch template versions to check, starting from the most recent version.

Type: String

Valid Values: `state-name | version-depth`

Required: No

**OptionValue.N**

A value for the specified option.

- For `state-name`:
  - Valid values: `pending` | `running` | `shutting-down` | `terminated` | `stopping` | `stopped`
  - Default: All states
- For `version-depth`:
  - Valid values: Integers between 1 and `10000`
  - Default: `10`

Type: Array of strings

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ResourceTypeRequest

A resource type to check for image references. Associated options can also be specified if the resource type is an EC2 instance or launch template.

## Contents

**ResourceType**

The resource type.

Type: String

Valid Values: `ec2:Instance | ec2:LaunchTemplate | ssm:Parameter | imagebuilder:ImageRecipe | imagebuilder:ContainerRecipe`

Required: No

**ResourceTypeOption.N**

The options that affect the scope of the response. Valid only when `ResourceType` is `ec2:Instance` or `ec2:LaunchTemplate`.

Type: Array of ResourceTypeOption objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ResponseError

Describes the error that's returned when you cannot delete a launch template version.

## Contents

**code**

The error code.

Type: String

Valid Values: `launchTemplateIdDoesNotExist | launchTemplateIdMalformed | launchTemplateNameDoesNotExist | launchTemplateNameMalformed | launchTemplateVersionDoesNotExist | unexpectedError`

Required: No

**message**

The error message, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ResponseLaunchTemplateData

The information for a launch template.

## Contents

**BlockDeviceMappingSet.N**

The block device mappings.

Type: Array of LaunchTemplateBlockDeviceMapping objects

Required: No

**capacityReservationSpecification**

Information about the Capacity Reservation targeting option.

Type: LaunchTemplateCapacityReservationSpecificationResponse object

Required: No

**cpuOptions**

The CPU options for the instance. For more information, see CPU options for Amazon EC2 instances in the *Amazon EC2 User Guide*.

Type: LaunchTemplateCpuOptions object

Required: No

**creditSpecification**

The credit option for CPU usage of the instance.

Type: CreditSpecification object

Required: No

**disableApiStop**

Indicates whether the instance is enabled for stop protection. For more information, see Enable stop protection for your EC2 instances in the *Amazon EC2 User Guide*.

Type: Boolean

Required: No

**disableApiTermination**

If set to `true`, indicates that the instance cannot be terminated using the Amazon EC2 console, command line tool, or API.

Type: Boolean

Required: No

**ebsOptimized**

Indicates whether the instance is optimized for Amazon EBS I/O.

Type: Boolean

Required: No

**ElasticGpuSpecificationSet.N**

Deprecated.

> **Note**
> Amazon Elastic Graphics reached end of life on January 8, 2024.

Type: Array of ElasticGpuSpecificationResponse objects

Required: No

**ElasticInferenceAcceleratorSet.N**

> **Note**
> Amazon Elastic Inference is no longer available.

An elastic inference accelerator to associate with the instance. Elastic inference accelerators are a resource you can attach to your Amazon EC2 instances to accelerate your Deep Learning (DL) inference workloads.

You cannot specify accelerators from different generations in the same request.

Type: Array of LaunchTemplateElasticInferenceAcceleratorResponse objects

Required: No

**enclaveOptions**

Indicates whether the instance is enabled for AWS Nitro Enclaves.

Type: LaunchTemplateEnclaveOptions object

Required: No

**hibernationOptions**

Indicates whether an instance is configured for hibernation. For more information, see Hibernate your Amazon EC2 instance in the *Amazon EC2 User Guide*.

Type: LaunchTemplateHibernationOptions object

Required: No

**iamInstanceProfile**

The IAM instance profile.

Type: LaunchTemplateIamInstanceProfileSpecification object

Required: No

**imageId**

The ID of the AMI or a Systems Manager parameter. The Systems Manager parameter will resolve to the ID of the AMI at instance launch.

The value depends on what you specified in the request. The possible values are:

- If an AMI ID was specified in the request, then this is the AMI ID.
- If a Systems Manager parameter was specified in the request, and `ResolveAlias` was configured as `true`, then this is the AMI ID that the parameter is mapped to in the Parameter Store.
- If a Systems Manager parameter was specified in the request, and `ResolveAlias` was configured as `false`, then this is the parameter value.

For more information, see Use a Systems Manager parameter instead of an AMI ID in the *Amazon EC2 User Guide*.

Type: String

Required: No

**instanceInitiatedShutdownBehavior**

Indicates whether an instance stops or terminates when you initiate shutdown from the instance (using the operating system command for system shutdown).

Type: String

Valid Values: `stop | terminate`

Required: No

**instanceMarketOptions**

The market (purchasing) option for the instances.

Type: LaunchTemplateInstanceMarketOptions object

Required: No

**instanceRequirements**

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with these attributes.

If you specify `InstanceRequirements`, you can't specify `InstanceTypes`.

Type: InstanceRequirements object

Required: No

**instanceType**

The instance type.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge |`

Required: No

**kernelId**

The ID of the kernel, if applicable.

Type: String

Required: No

**keyName**

The name of the key pair.

Type: String

Required: No

**LicenseSet.N**

The license configurations.

Type: Array of LaunchTemplateLicenseConfiguration objects

Required: No

**maintenanceOptions**

The maintenance options for your instance.

Type: LaunchTemplateInstanceMaintenanceOptions object

Required: No

**metadataOptions**

The metadata options for the instance. For more information, see Configure the Instance Metadata Service options in the *Amazon EC2 User Guide*.

Type: LaunchTemplateInstanceMetadataOptions object

Required: No

**monitoring**

The monitoring for the instance.

Type: LaunchTemplatesMonitoring object

Required: No

**NetworkInterfaceSet.N**

The network interfaces.

Type: Array of LaunchTemplateInstanceNetworkInterfaceSpecification objects

Required: No

**networkPerformanceOptions**

Contains the launch template settings for network performance options for your instance.

Type: LaunchTemplateNetworkPerformanceOptions object

Required: No

**operator**

The entity that manages the launch template.

Type: OperatorResponse object

Required: No

**placement**

The placement of the instance.

Type: LaunchTemplatePlacement object

Required: No

**privateDnsNameOptions**

The options for the instance hostname.

Type: LaunchTemplatePrivateDnsNameOptions object

Required: No

**ramDiskId**

The ID of the RAM disk, if applicable.

Type: String

Required: No

**SecondaryInterfaceSet.N**

The secondary interfaces associated with the launch template.

Type: Array of LaunchTemplateInstanceSecondaryInterfaceSpecification objects

Required: No

**SecurityGroupIdSet.N**

The security group IDs.

Type: Array of strings

Required: No

**SecurityGroupSet.N**

The security group names.

Type: Array of strings

Required: No

**TagSpecificationSet.N**

The tags that are applied to the resources that are created during instance launch.

Type: Array of LaunchTemplateTagSpecification objects

Required: No

**userData**

The user data for the instance.

Type: String

Required: No

# RevokedSecurityGroupRule

A security group rule removed with RevokeSecurityGroupEgress or RevokeSecurityGroupIngress.

## Contents

**cidrIpv4**

The IPv4 CIDR of the traffic source.

Type: String

Required: No

**cidrIpv6**

The IPv6 CIDR of the traffic source.

Type: String

Required: No

**description**

A description of the revoked security group rule.

Type: String

Required: No

**fromPort**

The 'from' port number of the security group rule.

Type: Integer

Required: No

**groupId**

A security group ID.

Type: String

Required: No

**ipProtocol**

The security group rule's protocol.

Type: String

Required: No

**isEgress**

Defines if a security group rule is an outbound rule.

Type: Boolean

Required: No

**prefixListId**

The ID of a prefix list that's the traffic source.

Type: String

Required: No

**referencedGroupId**

The ID of a referenced security group.

Type: String

Required: No

**securityGroupRuleId**

A security group rule ID.

Type: String

Required: No

**toPort**

The 'to' port number of the security group rule.

Type: Integer

Required: No

# Route

Describes a route in a route table.

## Contents

**carrierGatewayId**

The ID of the carrier gateway.

Type: String

Required: No

**coreNetworkArn**

The Amazon Resource Name (ARN) of the core network.

Type: String

Required: No

**destinationCidrBlock**

The IPv4 CIDR block used for the destination match.

Type: String

Required: No

**destinationIpv6CidrBlock**

The IPv6 CIDR block used for the destination match.

Type: String

Required: No

**destinationPrefixListId**

The prefix of the AWS service.

Type: String

Required: No

**egressOnlyInternetGatewayId**

The ID of the egress-only internet gateway.

Type: String

Required: No

**gatewayId**

The ID of a gateway attached to your VPC.

Type: String

Required: No

**instanceId**

The ID of a NAT instance in your VPC.

Type: String

Required: No

**instanceOwnerId**

The ID of AWS account that owns the instance.

Type: String

Required: No

**ipAddress**

The next hop IP address for routes propagated by VPC Route Server into VPC route tables.

Type: String

Required: No

**localGatewayId**

The ID of the local gateway.

Type: String

Required: No

**natGatewayId**

The ID of a NAT gateway.

Type: String

Required: No

**networkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**odbNetworkArn**

The Amazon Resource Name (ARN) of the ODB network.

Type: String

Required: No

**origin**

Describes how the route was created.

- `CreateRouteTable` - The route was automatically created when the route table was created.
- `CreateRoute` - The route was manually added to the route table.
- `EnableVgwRoutePropagation` - The route was propagated by route propagation.
- `Advertisement` - The route was created dynamically by Amazon VPC Route Server.

Type: String

Valid Values: `CreateRouteTable | CreateRoute | EnableVgwRoutePropagation`

Required: No

**state**

The state of the route. The `blackhole` state indicates that the route's target isn't available (for example, the specified gateway isn't attached to the VPC, or the specified NAT instance has been terminated).

Type: String

Valid Values: `active | blackhole`

Required: No

**transitGatewayId**

The ID of a transit gateway.

Type: String

Required: No

**vpcPeeringConnectionId**

The ID of a VPC peering connection.

Type: String

Required: No

- AWS SDK for Ruby V3

# RouteServer

Describes a route server and its configuration.

Amazon VPC Route Server simplifies routing for traffic between workloads that are deployed within a VPC and its internet gateways. With this feature, VPC Route Server dynamically updates VPC and internet gateway route tables with your preferred IPv4 or IPv6 routes to achieve routing fault tolerance for those workloads. This enables you to automatically reroute traffic within a VPC, which increases the manageability of VPC routing and interoperability with third-party workloads.

Route server supports the follow route table types:

- VPC route tables not associated with subnets
- Subnet route tables
- Internet gateway route tables

Route server does not support route tables associated with virtual private gateways. To propagate routes into a transit gateway route table, use Transit Gateway Connect.

## Contents

**amazonSideAsn**

The Border Gateway Protocol (BGP) Autonomous System Number (ASN) for the appliance. Valid values are from 1 to 4294967295. We recommend using a private ASN in the 64512–65534 (16-bit ASN) or 4200000000–4294967294 (32-bit ASN) range.

Type: Long

Required: No

**persistRoutesDuration**

The number of minutes a route server will wait after BGP is re-established to unpersist the routes in the FIB and RIB. Value must be in the range of 1-5. The default value is 1. Only valid if `persistRoutesState` is 'enabled'.

If you set the duration to 1 minute, then when your network appliance re-establishes BGP with route server, it has 1 minute to relearn it's adjacent network and advertise those routes to route server before route server resumes normal functionality. In most cases, 1 minute is probably

sufficient. If, however, you have concerns that your BGP network may not be capable of fully re-establishing and re-learning everything in 1 minute, you can increase the duration up to 5 minutes.

Type: Long

Required: No

**persistRoutesState**

The current state of route persistence for the route server.

Type: String

Valid Values: `enabling | enabled | resetting | disabling | disabled | modifying`

Required: No

**routeServerId**

The unique identifier of the route server.

Type: String

Required: No

**snsNotificationsEnabled**

Indicates whether SNS notifications are enabled for the route server. Enabling SNS notifications persists BGP status changes to an SNS topic provisioned by AWS.

Type: Boolean

Required: No

**snsTopicArn**

The ARN of the SNS topic where notifications are published.

Type: String

Required: No

**state**

The current state of the route server.

Type: String

Valid Values: `pending | available | modifying | deleting | deleted`

Required: No

**TagSet.N**

Any tags assigned to the route server.

Type: Array of Tag objects

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteServerAssociation

Describes the association between a route server and a VPC.

A route server association is the connection established between a route server and a VPC.

## Contents

**routeServerId**

The ID of the associated route server.

Type: String

Required: No

**state**

The current state of the association.

Type: String

Valid Values: `associating | associated | disassociating`

Required: No

**vpcId**

The ID of the associated VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteServerBfdStatus

The current status of Bidirectional Forwarding Detection (BFD) for a BGP session.

## Contents

**status**

The operational status of the BFD session.

Type: String

Valid Values: up | down

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteServerBgpOptions

The BGP configuration options for a route server peer.

## Contents

**peerAsn**

The Border Gateway Protocol (BGP) Autonomous System Number (ASN) for the appliance. Valid values are from 1 to 4294967295. We recommend using a private ASN in the 64512–65534 (16-bit ASN) or 4200000000–4294967294 (32-bit ASN) range.

Type: Long

Required: No

**peerLivenessDetection**

The liveness detection protocol used for the BGP peer.

The requested liveness detection protocol for the BGP peer.

- `bgp-keepalive`: The standard BGP keep alive mechanism (RFC4271) that is stable but may take longer to fail-over in cases of network impact or router failure.
- `bfd`: An additional Bidirectional Forwarding Detection (BFD) protocol (RFC5880) that enables fast failover by using more sensitive liveness detection.

Defaults to `bgp-keepalive`.

Type: String

Valid Values: `bfd | bgp-keepalive`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteServerBgpOptionsRequest

The BGP configuration options requested for a route server peer.

## Contents

**PeerAsn**

The Border Gateway Protocol (BGP) Autonomous System Number (ASN) for the appliance. Valid values are from 1 to 4294967295. We recommend using a private ASN in the 64512–65534 (16-bit ASN) or 4200000000–4294967294 (32-bit ASN) range.

Type: Long

Required: Yes

**PeerLivenessDetection**

The requested liveness detection protocol for the BGP peer.

- `bgp-keepalive`: The standard BGP keep alive mechanism (RFC4271) that is stable but may take longer to fail-over in cases of network impact or router failure.
- `bfd`: An additional Bidirectional Forwarding Detection (BFD) protocol (RFC5880) that enables fast failover by using more sensitive liveness detection.

Defaults to `bgp-keepalive`.

Type: String

Valid Values: `bfd | bgp-keepalive`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteServerBgpStatus

The current status of a BGP session.

## Contents

**status**

The operational status of the BGP session. The status enables you to monitor session liveness if you lack monitoring on your router/appliance.

Type: String

Valid Values: `up` | `down`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteServerEndpoint

Describes a route server endpoint and its properties.

A route server endpoint is an AWS-managed component inside a subnet that facilitates BGP (Border Gateway Protocol) connections between your route server and your BGP peers.

## Contents

**eniAddress**

The IP address of the Elastic network interface for the endpoint.

Type: String

Required: No

**eniId**

The ID of the Elastic network interface for the endpoint.

Type: String

Required: No

**failureReason**

The reason for any failure in endpoint creation or operation.

Type: String

Required: No

**routeServerEndpointId**

The unique identifier of the route server endpoint.

Type: String

Required: No

**routeServerId**

The ID of the route server associated with this endpoint.

Type: String

Required: No

**state**

The current state of the route server endpoint.

Type: String

Valid Values: `pending | available | deleting | deleted | failing | failed | delete-failed`

Required: No

**subnetId**

The ID of the subnet to place the route server endpoint into.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the route server endpoint.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC containing the endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# RouteServerPeer

Describes a BGP peer configuration for a route server endpoint.

A route server peer is a session between a route server endpoint and the device deployed in AWS (such as a firewall appliance or other network security function running on an EC2 instance). The device must meet these requirements:

- Have an elastic network interface in the VPC
- Support BGP (Border Gateway Protocol)
- Can initiate BGP sessions

## Contents

**bfdStatus**

The current status of the BFD session with this peer.

Type: RouteServerBfdStatus object

Required: No

**bgpOptions**

The BGP configuration options for this peer, including ASN (Autonomous System Number) and BFD (Bidirectional Forwarding Detection) settings.

Type: RouteServerBgpOptions object

Required: No

**bgpStatus**

The current status of the BGP session with this peer.

Type: RouteServerBgpStatus object

Required: No

**endpointEniAddress**

The IP address of the Elastic network interface for the route server endpoint.

Type: String

Required: No

**endpointEniId**

The ID of the Elastic network interface for the route server endpoint.

Type: String

Required: No

**failureReason**

The reason for any failure in peer creation or operation.

Type: String

Required: No

**peerAddress**

The IPv4 address of the peer device.

Type: String

Required: No

**routeServerEndpointId**

The ID of the route server endpoint associated with this peer.

Type: String

Required: No

**routeServerId**

The ID of the route server associated with this peer.

Type: String

Required: No

**routeServerPeerId**

The unique identifier of the route server peer.

Type: String

Required: No

**state**

The current state of the route server peer.

Type: String

Valid Values: `pending | available | deleting | deleted | failing | failed`

Required: No

**subnetId**

The ID of the subnet containing the route server peer.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the route server peer.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC containing the route server peer.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# RouteServerPropagation

Describes the route propagation configuration between a route server and a route table.

When enabled, route server propagation installs the routes in the FIB on the route table you've specified. Route server supports IPv4 and IPv6 route propagation.

## Contents

**routeServerId**

The ID of the route server configured for route propagation.

Type: String

Required: No

**routeTableId**

The ID of the route table configured for route server propagation.

Type: String

Required: No

**state**

The current state of route propagation.

Type: String

Valid Values: `pending | available | deleting`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# RouteServerRoute

Describes a route in the route server's routing database.

## Contents

**AsPathSet.N**

The AS path attributes of the BGP route.

Type: Array of strings

Required: No

**med**

The Multi-Exit Discriminator (MED) value of the BGP route.

Type: Integer

Required: No

**nextHopIp**

The IP address for the next hop.

Type: String

Required: No

**prefix**

The destination CIDR block of the route.

Type: String

Required: No

**RouteInstallationDetailSet.N**

Details about the installation status of this route in route tables.

Type: Array of RouteServerRouteInstallationDetail objects

Required: No

**routeServerEndpointId**

The ID of the route server endpoint that received this route.

Type: String

Required: No

**routeServerPeerId**

The ID of the route server peer that advertised this route.

Type: String

Required: No

**routeStatus**

The current status of the route in the routing database. Values are `in-rib` or `in-fib` depending on if the routes are in the RIB or the FIB database.

The Routing Information Base (RIB) serves as a database that stores all the routing information and network topology data collected by a router or routing system, such as routes learned from BGP peers. The RIB is constantly updated as new routing information is received or existing routes change. This ensures that the route server always has the most current view of the network topology and can make optimal routing decisions.

The Forwarding Information Base (FIB) serves as a forwarding table for what route server has determined are the best-path routes in the RIB after evaluating all available routing information and policies. The FIB routes are installed on the route tables. The FIB is recomputed whenever there are changes to the RIB.

Type: String

Valid Values: `in-rib | in-fib`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteServerRouteInstallationDetail

Describes the installation status of a route in a route table.

## Contents

**routeInstallationStatus**

The current installation status of the route in the route table.

Type: String

Valid Values: `installed | rejected`

Required: No

**routeInstallationStatusReason**

The reason for the current installation status of the route.

Type: String

Required: No

**routeTableId**

The ID of the route table where the route is being installed.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteTable

Describes a route table.

## Contents

**AssociationSet.N**

The associations between the route table and your subnets or gateways.

Type: Array of RouteTableAssociation objects

Required: No

**ownerId**

The ID of the AWS account that owns the route table.

Type: String

Required: No

**PropagatingVgwSet.N**

Any virtual private gateway (VGW) propagating routes.

Type: Array of PropagatingVgw objects

Required: No

**RouteSet.N**

The routes in the route table.

Type: Array of Route objects

Required: No

**routeTableId**

The ID of the route table.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the route table.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteTableAssociation

Describes an association between a route table and a subnet or gateway.

## Contents

**associationState**

The state of the association.

Type: RouteTableAssociationState object

Required: No

**gatewayId**

The ID of the internet gateway or virtual private gateway.

Type: String

Required: No

**main**

Indicates whether this is the main route table.

Type: Boolean

Required: No

**publicIpv4Pool**

The ID of a public IPv4 pool. A public IPv4 pool is a pool of IPv4 addresses that you've brought to AWS with BYOIP.

Type: String

Required: No

**routeTableAssociationId**

The ID of the association.

Type: String

Required: No

**routeTableId**

The ID of the route table.

Type: String

Required: No

**subnetId**

The ID of the subnet. A subnet ID is not returned for an implicit association.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RouteTableAssociationState

Describes the state of an association between a route table and a subnet or gateway.

## Contents

**state**

The state of the association.

Type: String

Valid Values: `associating | associated | disassociating | disassociated | failed`

Required: No

**statusMessage**

The status message, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RuleGroupRuleOptionsPair

Describes the rule options for a stateful rule group.

## Contents

**ruleGroupArn**

The ARN of the rule group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**RuleOptionSet.N**

The rule options.

Type: Array of RuleOption objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RuleGroupTypePair

Describes the type of a stateful rule group.

## Contents

**ruleGroupArn**

The ARN of the rule group.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**ruleGroupType**

The rule group type. The possible values are `Domain List` and `Suricata`.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RuleOption

Describes additional settings for a stateful rule.

## Contents

**keyword**

The Suricata keyword.

Type: String

Required: No

**SettingSet.N**

The settings for the keyword.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# RunInstancesMonitoringEnabled

Describes the monitoring of an instance.

## Contents

**Enabled** (request), **enabled** (response)

Indicates whether detailed monitoring is enabled. Otherwise, basic monitoring is enabled.

Type: Boolean

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# S3ObjectTag

The tags to apply to the AMI object that will be stored in the Amazon S3 bucket. For more information, see Categorizing your storage using tags in the *Amazon Simple Storage Service User Guide*.

## Contents

**Key**

The key of the tag.

Constraints: Tag keys are case-sensitive and can be up to 128 Unicode characters in length. May not begin with `aws:`.

Type: String

Required: No

**Value**

The value of the tag.

Constraints: Tag values are case-sensitive and can be up to 256 Unicode characters in length.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# S3Storage

Describes the storage parameters for Amazon S3 and Amazon S3 buckets for an instance store-backed AMI.

## Contents

**AWSAccessKeyId** (request), **AWSAccessKeyId** (response)

The access key ID of the owner of the bucket. Before you specify a value for your access key ID, review and follow the guidance in Best Practices for AWS accounts in the *AWS Account ManagementReference Guide*.

Type: String

Required: No

**Bucket** (request), **bucket** (response)

The bucket in which to store the AMI. You can specify a bucket that you already own or a new bucket that Amazon EC2 creates on your behalf. If you specify a bucket that belongs to someone else, Amazon EC2 returns an error.

Type: String

Required: No

**Prefix** (request), **prefix** (response)

The beginning of the file name of the AMI.

Type: String

Required: No

**UploadPolicy** (request), **uploadPolicy** (response)

An Amazon S3 upload policy that gives Amazon EC2 permission to upload items into Amazon S3 on your behalf.

Type: Base64-encoded binary data object

Required: No

**UploadPolicySignature** (request), **uploadPolicySignature** (response)

The signature of the JSON document.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstance

Describes a Scheduled Instance.

## Contents

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**createDate**

The date when the Scheduled Instance was purchased.

Type: Timestamp

Required: No

**hourlyPrice**

The hourly price for a single instance.

Type: String

Required: No

**instanceCount**

The number of instances.

Type: Integer

Required: No

**instanceType**

The instance type.

Type: String

Required: No

**networkPlatform**

The network platform.

Type: String

Required: No

**nextSlotStartTime**

The time for the next schedule to start.

Type: Timestamp

Required: No

**platform**

The platform (`Linux/UNIX` or `Windows`).

Type: String

Required: No

**previousSlotEndTime**

The time that the previous schedule ended or will end.

Type: Timestamp

Required: No

**recurrence**

The schedule recurrence.

Type: ScheduledInstanceRecurrence object

Required: No

**scheduledInstanceId**

The Scheduled Instance ID.

Type: String

Required: No

**slotDurationInHours**

The number of hours in the schedule.

Type: Integer

Required: No

**termEndDate**

The end date for the Scheduled Instance.

Type: Timestamp

Required: No

**termStartDate**

The start date for the Scheduled Instance.

Type: Timestamp

Required: No

**totalScheduledInstanceHours**

The total number of hours for a single instance for the entire term.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstanceAvailability

Describes a schedule that is available for your Scheduled Instances.

## Contents

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availableInstanceCount**

The number of available instances.

Type: Integer

Required: No

**firstSlotStartTime**

The time period for the first schedule to start.

Type: Timestamp

Required: No

**hourlyPrice**

The hourly price for a single instance.

Type: String

Required: No

**instanceType**

The instance type. You can specify one of the C3, C4, M4, or R3 instance types.

Type: String

Required: No

**maxTermDurationInDays**

The maximum term. The only possible value is 365 days.

Type: Integer

Required: No

**minTermDurationInDays**

The minimum term. The only possible value is 365 days.

Type: Integer

Required: No

**networkPlatform**

The network platform.

Type: String

Required: No

**platform**

The platform (`Linux/UNIX` or `Windows`).

Type: String

Required: No

**purchaseToken**

The purchase token. This token expires in two hours.

Type: String

Required: No

**recurrence**

The schedule recurrence.

Type: ScheduledInstanceRecurrence object

Required: No

**slotDurationInHours**

The number of hours in the schedule.

Type: Integer

Required: No

**totalScheduledInstanceHours**

The total number of hours for a single instance for the entire term.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstanceRecurrence

Describes the recurring schedule for a Scheduled Instance.

## Contents

**frequency**

The frequency (`Daily`, `Weekly`, or `Monthly`).

Type: String

Required: No

**interval**

The interval quantity. The interval unit depends on the value of `frequency`. For example, every 2 weeks or every 2 months.

Type: Integer

Required: No

**OccurrenceDaySet.N**

The days. For a monthly schedule, this is one or more days of the month (1-31). For a weekly schedule, this is one or more days of the week (1-7, where 1 is Sunday).

Type: Array of integers

Required: No

**occurrenceRelativeToEnd**

Indicates whether the occurrence is relative to the end of the specified week or month.

Type: Boolean

Required: No

**occurrenceUnit**

The unit for `occurrenceDaySet` (`DayOfWeek` or `DayOfMonth`).

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstanceRecurrenceRequest

Describes the recurring schedule for a Scheduled Instance.

## Contents

**Frequency**

The frequency (`Daily`, `Weekly`, or `Monthly`).

Type: String

Required: No

**Interval**

The interval quantity. The interval unit depends on the value of `Frequency`. For example, every 2 weeks or every 2 months.

Type: Integer

Required: No

**OccurrenceDay.N**

The days. For a monthly schedule, this is one or more days of the month (1-31). For a weekly schedule, this is one or more days of the week (1-7, where 1 is Sunday). You can't specify this value with a daily schedule. If the occurrence is relative to the end of the month, you can specify only a single day.

Type: Array of integers

Required: No

**OccurrenceRelativeToEnd**

Indicates whether the occurrence is relative to the end of the specified week or month. You can't specify this value with a daily schedule.

Type: Boolean

Required: No

**OccurrenceUnit**

The unit for `OccurrenceDays` (`DayOfWeek` or `DayOfMonth`). This value is required for a monthly schedule. You can't specify `DayOfWeek` with a weekly schedule. You can't specify this value with a daily schedule.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesBlockDeviceMapping

Describes a block device mapping for a Scheduled Instance.

## Contents

**DeviceName**

The device name (for example, `/dev/sdh` or `xvdh`).

Type: String

Required: No

**Ebs**

Parameters used to set up EBS volumes automatically when the instance is launched.

Type: ScheduledInstancesEbs object

Required: No

**NoDevice**

To omit the device from the block device mapping, specify an empty string.

Type: String

Required: No

**VirtualName**

The virtual device name (`ephemeralN`). Instance store volumes are numbered starting from 0. An instance type with two available instance store volumes can specify mappings for `ephemeral0` and `ephemeral1`. The number of available instance store volumes depends on the instance type. After you connect to the instance, you must mount the volume.

Constraints: For M3 instances, you must specify instance store volumes in the block device mapping for the instance. When you launch an M3 instance, we ignore any instance store volumes specified in the block device mapping for the AMI.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesEbs

Describes an EBS volume for a Scheduled Instance.

## Contents

**DeleteOnTermination**

Indicates whether the volume is deleted on instance termination.

Type: Boolean

Required: No

**Encrypted**

Indicates whether the volume is encrypted. You can attached encrypted volumes only to instances that support them.

Type: Boolean

Required: No

**Iops**

The number of I/O operations per second (IOPS) to provision for a `gp3`, `io1`, or `io2` volume.

Type: Integer

Required: No

**SnapshotId**

The ID of the snapshot.

Type: String

Required: No

**VolumeSize**

The size of the volume, in GiB.

Default: If you're creating the volume from a snapshot and don't specify a volume size, the default is the snapshot size.

Type: Integer

Required: No

**VolumeType**

The volume type.

Default: gp2

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesIamInstanceProfile

Describes an IAM instance profile for a Scheduled Instance.

## Contents

**Arn**

The Amazon Resource Name (ARN).

Type: String

Required: No

**Name**

The name.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesIpv6Address

Describes an IPv6 address.

## Contents

### Ipv6Address

The IPv6 address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesLaunchSpecification

Describes the launch specification for a Scheduled Instance.

If you are launching the Scheduled Instance in EC2-VPC, you must specify the ID of the subnet. You can specify the subnet using either `SubnetId` or `NetworkInterface`.

## Contents

**ImageId**

The ID of the Amazon Machine Image (AMI).

Type: String

Required: Yes

**BlockDeviceMapping.N**

The block device mapping entries.

Type: Array of ScheduledInstancesBlockDeviceMapping objects

Required: No

**EbsOptimized**

Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS-optimized instance.

Default: `false`

Type: Boolean

Required: No

**IamInstanceProfile**

The IAM instance profile.

Type: ScheduledInstancesIamInstanceProfile object

Required: No

**InstanceType**

The instance type.

Type: String

Required: No

**KernelId**

The ID of the kernel.

Type: String

Required: No

**KeyName**

The name of the key pair.

Type: String

Required: No

**Monitoring**

Enable or disable monitoring for the instances.

Type: ScheduledInstancesMonitoring object

Required: No

**NetworkInterface.N**

The network interfaces.

Type: Array of ScheduledInstancesNetworkInterface objects

Required: No

**Placement**

The placement information.

Type: ScheduledInstancesPlacement object

Required: No

**RamdiskId**

The ID of the RAM disk.

Type: String

Required: No

**SecurityGroupId.N**

The IDs of the security groups.

Type: Array of strings

Required: No

**SubnetId**

The ID of the subnet in which to launch the instances.

Type: String

Required: No

**UserData**

The base64-encoded MIME user data.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesMonitoring

Describes whether monitoring is enabled for a Scheduled Instance.

## Contents

**Enabled**

Indicates whether monitoring is enabled.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesNetworkInterface

Describes a network interface for a Scheduled Instance.

## Contents

**AssociatePublicIpAddress**

Indicates whether to assign a public IPv4 address to instances launched in a VPC. The public IPv4 address can only be assigned to a network interface for eth0, and can only be assigned to a new network interface, not an existing one. You cannot specify more than one network interface in the request. If launching into a default subnet, the default value is `true`.

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the *Public IPv4 Address* tab on the Amazon VPC pricing page.

Type: Boolean

Required: No

**DeleteOnTermination**

Indicates whether to delete the interface when the instance is terminated.

Type: Boolean

Required: No

**Description**

The description.

Type: String

Required: No

**DeviceIndex**

The index of the device for the network interface attachment.

Type: Integer

Required: No

**Group.N**

The IDs of the security groups.

Type: Array of strings

Required: No

**Ipv6Address.N**

The specific IPv6 addresses from the subnet range.

Type: Array of ScheduledInstancesIpv6Address objects

Required: No

**Ipv6AddressCount**

The number of IPv6 addresses to assign to the network interface. The IPv6 addresses are automatically selected from the subnet range.

Type: Integer

Required: No

**NetworkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**PrivateIpAddress**

The IPv4 address of the network interface within the subnet.

Type: String

Required: No

**PrivateIpAddressConfig.N**

The private IPv4 addresses.

Type: Array of ScheduledInstancesPrivateIpAddressConfig objects

Required: No

**SecondaryPrivateIpAddressCount**

The number of secondary private IPv4 addresses.

Type: Integer

Required: No

**SubnetId**

The ID of the subnet.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesPlacement

Describes the placement for a Scheduled Instance.

## Contents

**AvailabilityZone**

The Availability Zone.

Type: String

Required: No

**GroupName**

The name of the placement group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ScheduledInstancesPrivateIpAddressConfig

Describes a private IPv4 address for a Scheduled Instance.

## Contents

**Primary**

Indicates whether this is a primary IPv4 address. Otherwise, this is a secondary IPv4 address.

Type: Boolean

Required: No

**PrivateIpAddress**

The IPv4 address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecondaryInterface

Describes a secondary interface.

## Contents

**attachment**

The attachment information for the secondary interface.

Type: SecondaryInterfaceAttachment object

Required: No

**availabilityZone**

The Availability Zone of the secondary interface.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone of the secondary interface.

Type: String

Required: No

**macAddress**

The MAC address of the secondary interface.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the secondary interface.

Type: String

Required: No

**PrivateIpv4AddressSet.N**

The private IPv4 addresses associated with the secondary interface.

Type: Array of SecondaryInterfaceIpv4Address objects

Required: No

**secondaryInterfaceArn**

The Amazon Resource Name (ARN) of the secondary interface.

Type: String

Required: No

**secondaryInterfaceId**

The ID of the secondary interface.

Type: String

Required: No

**secondaryInterfaceType**

The type of secondary interface.

Type: String

Valid Values: `secondary`

Required: No

**secondaryNetworkId**

The ID of the secondary network.

Type: String

Required: No

**secondaryNetworkType**

The type of the secondary network.

Type: String

Valid Values: `rdma`

Required: No

**secondarySubnetId**

The ID of the secondary subnet.

Type: String

Required: No

**sourceDestCheck**

Indicates whether source/destination checking is enabled.

Type: Boolean

Required: No

**status**

The status of the secondary interface.

Type: String

Valid Values: `available | in-use`

Required: No

**TagSet.N**

The tags assigned to the secondary interface.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# SecondaryInterfaceAttachment

Describes the attachment of a secondary interface to an instance.

## Contents

**attachmentId**

The ID of the attachment.

Type: String

Required: No

**attachTime**

The timestamp when the attachment was created.

Type: Timestamp

Required: No

**deleteOnTermination**

Indicates whether the secondary interface is deleted when the instance is terminated.

The only supported value for this field is `true`.

Type: Boolean

Required: No

**deviceIndex**

The device index of the secondary interface.

Type: Integer

Required: No

**instanceId**

The ID of the instance to which the secondary interface is attached.

Type: String

Required: No

**instanceOwnerId**

The AWS account ID of the owner of the instance.

Type: String

Required: No

**networkCardIndex**

The index of the network card.

Type: Integer

Required: No

**status**

The attachment state.

Type: String

Valid Values: `attaching | attached | detaching | detached`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecondaryInterfaceIpv4Address

Describes a private IPv4 address for a secondary interface.

## Contents

**privateIpAddress**

The private IPv4 address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecondaryInterfacePrivateIpAddressSpecification

Describes a private IPv4 address specification for a secondary interface.

## Contents

**privateIpAddress**

The private IPv4 address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecondaryInterfacePrivateIpAddressSpecificationRequest

Describes a private IPv4 address specification for a secondary interface request.

## Contents

**PrivateIpAddress**

The private IPv4 address.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecondaryNetwork

Describes a secondary network.

## Contents

**Ipv4CidrBlockAssociationSet.N**

Information about the IPv4 CIDR blocks associated with the secondary network.

Type: Array of SecondaryNetworkIpv4CidrBlockAssociation objects

Required: No

**ownerId**

The ID of the AWS account that owns the secondary network.

Type: String

Required: No

**secondaryNetworkArn**

The Amazon Resource Name (ARN) of the secondary network.

Type: String

Required: No

**secondaryNetworkId**

The ID of the secondary network.

Type: String

Required: No

**state**

The state of the secondary network.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | delete-in-progress | delete-complete | delete-failed`

Required: No

**stateReason**

The reason for the current state of the secondary network.

Type: String

Required: No

**TagSet.N**

The tags assigned to the secondary network.

Type: Array of Tag objects

Required: No

**type**

The type of the secondary network.

Type: String

Valid Values: `rdma`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecondaryNetworkIpv4CidrBlockAssociation

Describes an IPv4 CIDR block associated with a secondary network.

## Contents

**associationId**

The association ID for the IPv4 CIDR block.

Type: String

Required: No

**cidrBlock**

The IPv4 CIDR block.

Type: String

Required: No

**state**

The state of the CIDR block association.

Type: String

Valid Values: `associating | associated | association-failed | disassociating | disassociated | disassociation-failed`

Required: No

**stateReason**

The reason for the current state of the CIDR block association.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecondarySubnet

Describes a secondary subnet.

## Contents

**availabilityZone**

The Availability Zone of the secondary subnet.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone of the secondary subnet.

Type: String

Required: No

**Ipv4CidrBlockAssociationSet.N**

Information about the IPv4 CIDR blocks associated with the secondary subnet.

Type: Array of SecondarySubnetIpv4CidrBlockAssociation objects

Required: No

**ownerId**

The ID of the AWS account that owns the secondary subnet.

Type: String

Required: No

**secondaryNetworkId**

The ID of the secondary network.

Type: String

Required: No

**secondaryNetworkType**

The type of the secondary network.

Type: String

Valid Values: `rdma`

Required: No

**secondarySubnetArn**

The Amazon Resource Name (ARN) of the secondary subnet.

Type: String

Required: No

**secondarySubnetId**

The ID of the secondary subnet.

Type: String

Required: No

**state**

The state of the secondary subnet.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | delete-in-progress | delete-complete | delete-failed`

Required: No

**stateReason**

The reason for the current state of the secondary subnet.

Type: String

Required: No

**TagSet.N**

The tags assigned to the secondary subnet.

Type: Array of Tag objects

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecondarySubnetIpv4CidrBlockAssociation

Describes an IPv4 CIDR block associated with a secondary subnet.

## Contents

**associationId**

The association ID for the IPv4 CIDR block.

Type: String

Required: No

**cidrBlock**

The IPv4 CIDR block.

Type: String

Required: No

**state**

The state of the CIDR block association.

Type: String

Valid Values: `associating | associated | association-failed | disassociating | disassociated | disassociation-failed`

Required: No

**stateReason**

The reason for the current state of the CIDR block association.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecureBlobAttributeValue

## Contents

### Value

Type: Base64-encoded binary data object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroup

Describes a security group.

## Contents

**groupDescription**

A description of the security group.

Type: String

Required: No

**groupId**

The ID of the security group.

Type: String

Required: No

**groupName**

The name of the security group.

Type: String

Required: No

**IpPermissions.N**

The inbound rules associated with the security group.

Type: Array of IpPermission objects

Required: No

**IpPermissionsEgress.N**

The outbound rules associated with the security group.

Type: Array of IpPermission objects

Required: No

**ownerId**

The AWS account ID of the owner of the security group.

Type: String

Required: No

**securityGroupArn**

The ARN of the security group.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the security group.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC for the security group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroupForVpc

A security group that can be used by interfaces in the VPC.

## Contents

**description**

The security group's description.

Type: String

Required: No

**groupId**

The security group ID.

Type: String

Required: No

**groupName**

The security group name.

Type: String

Required: No

**ownerId**

The security group owner ID.

Type: String

Required: No

**primaryVpcId**

The VPC ID in which the security group was created.

Type: String

Required: No

**TagSet.N**

The security group tags.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroupIdentifier

Describes a security group.

## Contents

**groupId**

The ID of the security group.

Type: String

Required: No

**groupName**

The name of the security group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroupReference

Describes a VPC with a security group that references your security group.

## Contents

**groupId**

The ID of your security group.

Type: String

Required: No

**referencingVpcId**

The ID of the VPC with the referencing security group.

Type: String

Required: No

**transitGatewayId**

The ID of the transit gateway (if applicable).

Type: String

Required: No

**vpcPeeringConnectionId**

The ID of the VPC peering connection (if applicable). For more information about security group referencing for peering connections, see Update your security groups to reference peer security groups in the *VPC Peering Guide*.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroupRule

Describes a security group rule.

## Contents

**cidrIpv4**

The IPv4 CIDR range.

Type: String

Required: No

**cidrIpv6**

The IPv6 CIDR range.

Type: String

Required: No

**description**

The security group rule description.

Type: String

Required: No

**fromPort**

If the protocol is TCP or UDP, this is the start of the port range. If the protocol is ICMP or ICMPv6, this is the ICMP type or -1 (all ICMP types).

Type: Integer

Required: No

**groupId**

The ID of the security group.

Type: String

Required: No

**groupOwnerId**

The ID of the AWS account that owns the security group.

Type: String

Required: No

**ipProtocol**

The IP protocol name (`tcp`, `udp`, `icmp`, `icmpv6`) or number (see Protocol Numbers).

Use `-1` to specify all protocols.

Type: String

Required: No

**isEgress**

Indicates whether the security group rule is an outbound rule.

Type: Boolean

Required: No

**prefixListId**

The ID of the prefix list.

Type: String

Required: No

**referencedGroupInfo**

Describes the security group that is referenced in the rule.

Type: ReferencedSecurityGroup object

Required: No

**securityGroupRuleArn**

The ARN of the security group rule.

Type: String

Required: No

**securityGroupRuleId**

The ID of the security group rule.

Type: String

Required: No

**TagSet.N**

The tags applied to the security group rule.

Type: Array of Tag objects

Required: No

**toPort**

If the protocol is TCP or UDP, this is the end of the port range. If the protocol is ICMP or ICMPv6, this is the ICMP code or -1 (all ICMP codes). If the start port is -1 (all ICMP types), then the end port must be -1 (all ICMP codes).

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroupRuleDescription

Describes the description of a security group rule.

You can use this when you want to update the security group rule description for either an inbound or outbound rule.

## Contents

**Description**

The description of the security group rule.

Type: String

Required: No

**SecurityGroupRuleId**

The ID of the security group rule.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroupRuleRequest

Describes a security group rule.

You must specify exactly one of the following parameters, based on the rule type:

- CidrIpv4
- CidrIpv6
- PrefixListId
- ReferencedGroupId

> **Note**
>
> AWS canonicalizes IPv4 and IPv6 CIDRs. For example, if you specify 100.68.0.18/18 for the CIDR block, AWS canonicalizes the CIDR block to 100.68.0.0/18. Any subsequent DescribeSecurityGroups and DescribeSecurityGroupRules calls will return the canonicalized form of the CIDR block. Additionally, if you attempt to add another rule with the non-canonical form of the CIDR (such as 100.68.0.18/18) and there is already a rule for the canonicalized form of the CIDR block (such as 100.68.0.0/18), the API throws an duplicate rule error.

When you modify a rule, you cannot change the rule type. For example, if the rule uses an IPv4 address range, you must use `CidrIpv4` to specify a new IPv4 address range.

## Contents

**CidrIpv4**

The IPv4 CIDR range. To specify a single IPv4 address, use the /32 prefix length.

Type: String

Required: No

**CidrIpv6**

The IPv6 CIDR range. To specify a single IPv6 address, use the /128 prefix length.

Type: String

Required: No

**Description**

The description of the security group rule.

Type: String

Required: No

**FromPort**

If the protocol is TCP or UDP, this is the start of the port range. If the protocol is ICMP or ICMPv6, this is the ICMP type or -1 (all ICMP types).

Type: Integer

Required: No

**IpProtocol**

The IP protocol name (`tcp`, `udp`, `icmp`, `icmpv6`) or number (see Protocol Numbers).

Use `-1` to specify all protocols.

Type: String

Required: No

**PrefixListId**

The ID of the prefix list.

Type: String

Required: No

**ReferencedGroupId**

The ID of the security group that is referenced in the security group rule.

Type: String

Required: No

**ToPort**

If the protocol is TCP or UDP, this is the end of the port range. If the protocol is ICMP or ICMPv6, this is the ICMP code or -1 (all ICMP codes). If the start port is -1 (all ICMP types), then the end port must be -1 (all ICMP codes).

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroupRuleUpdate

Describes an update to a security group rule.

## Contents

**SecurityGroupRuleId**

The ID of the security group rule.

Type: String

Required: Yes

**SecurityGroupRule**

Information about the security group rule.

Type: SecurityGroupRuleRequest object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SecurityGroupVpcAssociation

A security group association with a VPC that you made with AssociateSecurityGroupVpc.

## Contents

**groupId**

The association's security group ID.

Type: String

Required: No

**groupOwnerId**

The AWS account ID of the owner of the security group.

Type: String

Required: No

**state**

The association's state.

Type: String

Valid Values: `associating | associated | association-failed | disassociating | disassociated | disassociation-failed`

Required: No

**stateReason**

The association's state reason.

Type: String

Required: No

**vpcId**

The association's VPC ID.

Type: String

Required: No

**vpcOwnerId**

The AWS account ID of the owner of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ServiceConfiguration

Describes a service configuration for a VPC endpoint service.

## Contents

**acceptanceRequired**

Indicates whether requests from other AWS accounts to create an endpoint to the service must first be accepted.

Type: Boolean

Required: No

**AvailabilityZoneIdSet.N**

The IDs of the Availability Zones in which the service is available.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both

Type: Array of strings

Required: No

**AvailabilityZoneSet.N**

The Availability Zones in which the service is available.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both

Type: Array of strings

Required: No

**BaseEndpointDnsNameSet.N**

The DNS names for the service.

Type: Array of strings

Required: No

**GatewayLoadBalancerArnSet.N**

The Amazon Resource Names (ARNs) of the Gateway Load Balancers for the service.

Type: Array of strings

Required: No

**managesVpcEndpoints**

Indicates whether the service manages its VPC endpoints. Management of the service VPC endpoints using the VPC endpoint API is restricted.

Type: Boolean

Required: No

**NetworkLoadBalancerArnSet.N**

The Amazon Resource Names (ARNs) of the Network Load Balancers for the service.

Type: Array of strings

Required: No

**payerResponsibility**

The payer responsibility.

Type: String

Valid Values: `ServiceOwner`

Required: No

**privateDnsName**

The private DNS name for the service.

Type: String

Required: No

**privateDnsNameConfiguration**

Information about the endpoint service private DNS name configuration.

Type: PrivateDnsNameConfiguration object

Required: No

**remoteAccessEnabled**

Indicates whether consumers can access the service from a Region other than the Region where the service is hosted.

Type: Boolean

Required: No

**serviceId**

The ID of the service.

Type: String

Required: No

**serviceName**

The name of the service.

Type: String

Required: No

**serviceState**

The service state.

Type: String

Valid Values: `Pending | Available | Deleting | Deleted | Failed`

Required: No

**ServiceType.N**

The type of service.

Type: Array of ServiceTypeDetail objects

Required: No

**SupportedIpAddressTypeSet.N**

The supported IP address types.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 2 items.

Valid Values: `ipv4 | ipv6`

Required: No

**SupportedRegionSet.N**

The supported Regions.

Type: Array of SupportedRegionDetail objects

Required: No

**TagSet.N**

The tags assigned to the service.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ServiceDetail

Describes a VPC endpoint service.

## Contents

**acceptanceRequired**

Indicates whether VPC endpoint connection requests to the service must be accepted by the service owner.

Type: Boolean

Required: No

**AvailabilityZoneIdSet.N**

The IDs of the Availability Zones in which the service is available.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both

Type: Array of strings

Required: No

**AvailabilityZoneSet.N**

The Availability Zones in which the service is available.

Either `AvailabilityZone` or `AvailabilityZoneId` can be specified, but not both

Type: Array of strings

Required: No

**BaseEndpointDnsNameSet.N**

The DNS names for the service.

Type: Array of strings

Required: No

**managesVpcEndpoints**

Indicates whether the service manages its VPC endpoints. Management of the service VPC endpoints using the VPC endpoint API is restricted.

Type: Boolean

Required: No

**owner**

The AWS account ID of the service owner.

Type: String

Required: No

**payerResponsibility**

The payer responsibility.

Type: String

Valid Values: `ServiceOwner`

Required: No

**privateDnsName**

The private DNS name for the service.

Type: String

Required: No

**PrivateDnsNameSet.N**

The private DNS names assigned to the VPC endpoint service.

Type: Array of PrivateDnsDetails objects

Required: No

**privateDnsNameVerificationState**

The verification state of the VPC endpoint service.

Consumers of the endpoint service cannot use the private name when the state is not `verified`.

Type: String

Valid Values: `pendingVerification | verified | failed`

Required: No

**serviceId**

The ID of the endpoint service.

Type: String

Required: No

**serviceName**

The name of the service.

Type: String

Required: No

**serviceRegion**

The Region where the service is hosted.

Type: String

Required: No

**ServiceType.N**

The type of service.

Type: Array of ServiceTypeDetail objects

Required: No

**SupportedIpAddressTypeSet.N**

The supported IP address types.

Type: Array of strings

Array Members: Minimum number of 0 items. Maximum number of 2 items.

Valid Values: `ipv4 | ipv6`

Required: No

**TagSet.N**

The tags assigned to the service.

Type: Array of Tag objects

Required: No

**vpcEndpointPolicySupported**

Indicates whether the service supports endpoint policies.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ServiceLinkVirtualInterface

Describes the service link virtual interfaces that establish connectivity between AWS Outpost and on-premises networks.

## Contents

**configurationState**

The current state of the service link virtual interface.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**localAddress**

The IPv4 address assigned to the local gateway virtual interface on the Outpost side.

Type: String

Required: No

**outpostArn**

The Outpost Amazon Resource Number (ARN) for the service link virtual interface.

Type: String

Required: No

**outpostId**

The Outpost ID for the service link virtual interface.

Type: String

Required: No

**outpostLagId**

The link aggregation group (LAG) ID for the service link virtual interface.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the service link virtual interface..

Type: String

Required: No

**peerAddress**

The IPv4 peer address for the service link virtual interface.

Type: String

Required: No

**peerBgpAsn**

The ASN for the Border Gateway Protocol (BGP) associated with the service link virtual interface.

Type: Long

Required: No

**serviceLinkVirtualInterfaceArn**

The Amazon Resource Number (ARN) for the service link virtual interface.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**serviceLinkVirtualInterfaceId**

The ID of the service link virtual interface.

Type: String

Required: No

**TagSet.N**

The tags associated with the service link virtual interface.

Type: Array of Tag objects

Required: No

**vlan**

The virtual local area network for the service link virtual interface.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ServiceTypeDetail

Describes the type of service for a VPC endpoint.

## Contents

**serviceType**

The type of service.

Type: String

Valid Values: `Interface | Gateway | GatewayLoadBalancer`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SlotDateTimeRangeRequest

Describes the time period for a Scheduled Instance to start its first schedule. The time period must span less than one day.

## Contents

**EarliestTime**

The earliest date and time, in UTC, for the Scheduled Instance to start.

Type: Timestamp

Required: Yes

**LatestTime**

The latest date and time, in UTC, for the Scheduled Instance to start. This value must be later than or equal to the earliest date and at most three months in the future.

Type: Timestamp

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SlotStartTimeRangeRequest

Describes the time period for a Scheduled Instance to start its first schedule.

## Contents

**EarliestTime**

The earliest date and time, in UTC, for the Scheduled Instance to start.

Type: Timestamp

Required: No

**LatestTime**

The latest date and time, in UTC, for the Scheduled Instance to start.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Snapshot

Describes a snapshot.

## Contents

**availabilityZone**

The Availability Zone or Local Zone of the snapshot. For example, `us-west-1a` (Availability Zone) or `us-west-2-lax-1a` (Local Zone).

Type: String

Required: No

**completionDurationMinutes**

> **Note**
> Only for snapshot copies created with time-based snapshot copy operations.

The completion duration requested for the time-based snapshot copy operation.

Type: Integer

Required: No

**completionTime**

The time stamp when the snapshot was completed.

Type: Timestamp

Required: No

**dataEncryptionKeyId**

The data encryption key identifier for the snapshot. This value is a unique identifier that corresponds to the data encryption key that was used to encrypt the original volume or snapshot copy. Because data encryption keys are inherited by volumes created from snapshots, and vice versa, if snapshots share the same data encryption key identifier, then they belong to the same volume/snapshot lineage. This parameter is only returned by DescribeSnapshots.

Type: String

Required: No

**description**

The description for the snapshot.

Type: String

Required: No

**encrypted**

Indicates whether the snapshot is encrypted.

Type: Boolean

Required: No

**fullSnapshotSizeInBytes**

The full size of the snapshot, in bytes.

> **Important**
>
> This is **not** the incremental size of the snapshot. This is the full snapshot size and represents the size of all the blocks that were written to the source volume at the time the snapshot was created.

Type: Long

Required: No

**kmsKeyId**

The Amazon Resource Name (ARN) of the AWS KMS key that was used to protect the volume encryption key for the parent volume.

Type: String

Required: No

**outpostArn**

The ARN of the Outpost on which the snapshot is stored. For more information, see Amazon EBS local snapshots on Outposts in the *Amazon EBS User Guide*.

Type: String

Required: No

**ownerAlias**

The AWS owner alias, from an Amazon-maintained list (`amazon`). This is not the user-configured AWS account alias set using the IAM console.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the EBS snapshot.

Type: String

Required: No

**progress**

The progress of the snapshot, as a percentage.

Type: String

Required: No

**restoreExpiryTime**

Only for archived snapshots that are temporarily restored. Indicates the date and time when a temporarily restored snapshot will be automatically re-archived.

Type: Timestamp

Required: No

**snapshotId**

The ID of the snapshot. Each snapshot receives a unique identifier when it is created.

Type: String

Required: No

**sseType**

Reserved for future use.

Type: String

Valid Values: `sse-ebs | sse-kms | none`

Required: No

**startTime**

The time stamp when the snapshot was initiated.

Type: Timestamp

Required: No

**status**

The snapshot state.

Type: String

Valid Values: `pending | completed | error | recoverable | recovering`

Required: No

**statusMessage**

Encrypted Amazon EBS snapshots are copied asynchronously. If a snapshot copy operation fails (for example, if the proper AWS KMS permissions are not obtained) this field displays error state details to help you diagnose why the error occurred. This parameter is only returned by DescribeSnapshots.

Type: String

Required: No

**storageTier**

The storage tier in which the snapshot is stored. `standard` indicates that the snapshot is stored in the standard snapshot storage tier and that it is ready for use. `archive` indicates that the snapshot is currently archived and that it must be restored before it can be used.

Type: String

Valid Values: `archive | standard`

Required: No

**TagSet.N**

Any tags assigned to the snapshot.

Type: Array of Tag objects

Required: No

**transferType**

> **Note**
> Only for snapshot copies.

Indicates whether the snapshot copy was created with a standard or time-based snapshot copy operation. Time-based snapshot copy operations complete within the completion duration specified in the request. Standard snapshot copy operations are completed on a best-effort basis.

- `standard` - The snapshot copy was created with a standard snapshot copy operation.
- `time-based` - The snapshot copy was created with a time-based snapshot copy operation.

Type: String

Valid Values: `time-based | standard`

Required: No

**volumeId**

The ID of the volume that was used to create the snapshot. Snapshots created by a copy snapshot operation have an arbitrary volume ID that you should not use for any purpose.

Type: String

Required: No

**volumeSize**

The size of the volume, in GiB.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SnapshotDetail

Describes the snapshot created from the imported disk.

## Contents

**description**

A description for the snapshot.

Type: String

Required: No

**deviceName**

The block device mapping for the snapshot.

Type: String

Required: No

**diskImageSize**

The size of the disk in the snapshot, in GiB.

Type: Double

Required: No

**format**

The format of the disk image from which the snapshot is created.

Type: String

Required: No

**progress**

The percentage of progress for the task.

Type: String

Required: No

**snapshotId**

The snapshot ID of the disk being imported.

Type: String

Required: No

**status**

A brief status of the snapshot creation.

Type: String

Required: No

**statusMessage**

A detailed status message for the snapshot creation.

Type: String

Required: No

**url**

The URL used to access the disk image.

Type: String

Required: No

**userBucket**

The Amazon S3 bucket for the disk image.

Type: UserBucketDetails object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SnapshotDiskContainer

The disk container object for the import snapshot request.

## Contents

**Description**

The description of the disk image being imported.

Type: String

Required: No

**Format**

The format of the disk image being imported.

Valid values: `VHD` | `VMDK` | `RAW`

Type: String

Required: No

**Url**

The URL to the Amazon S3-based disk image being imported. It can either be a https URL (https://..) or an Amazon S3 URL (s3://..).

Type: String

Required: No

**UserBucket**

The Amazon S3 bucket for the disk image.

Type: UserBucket object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SnapshotInfo

Information about a snapshot.

## Contents

**availabilityZone**

The Availability Zone or Local Zone of the snapshots. For example, `us-west-1a` (Availability Zone) or `us-west-2-lax-1a` (Local Zone).

Type: String

Required: No

**description**

Description specified by the CreateSnapshotRequest that has been applied to all snapshots.

Type: String

Required: No

**encrypted**

Indicates whether the snapshot is encrypted.

Type: Boolean

Required: No

**outpostArn**

The ARN of the Outpost on which the snapshot is stored. For more information, see Amazon EBS local snapshots on Outposts in the *Amazon EBS User Guide*.

Type: String

Required: No

**ownerId**

Account id used when creating this snapshot.

Type: String

Required: No

**progress**

Progress this snapshot has made towards completing.

Type: String

Required: No

**snapshotId**

Snapshot id that can be used to describe this snapshot.

Type: String

Required: No

**sseType**

Reserved for future use.

Type: String

Valid Values: `sse-ebs | sse-kms | none`

Required: No

**startTime**

Time this snapshot was started. This is the same for all snapshots initiated by the same request.

Type: Timestamp

Required: No

**state**

Current state of the snapshot.

Type: String

Valid Values: `pending | completed | error | recoverable | recovering`

Required: No

**TagSet.N**

Tags associated with this snapshot.

Type: Array of Tag objects

Required: No

**volumeId**

Source volume from which this snapshot was created.

Type: String

Required: No

**volumeSize**

Size of the volume from which this snapshot was created.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SnapshotRecycleBinInfo

Information about a snapshot that is currently in the Recycle Bin.

## Contents

**description**

The description for the snapshot.

Type: String

Required: No

**recycleBinEnterTime**

The date and time when the snapshot entered the Recycle Bin.

Type: Timestamp

Required: No

**recycleBinExitTime**

The date and time when the snapshot is to be permanently deleted from the Recycle Bin.

Type: Timestamp

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

**volumeId**

The ID of the volume from which the snapshot was created.

Type: String

Required: No

# SnapshotTaskDetail

Details about the import snapshot task.

## Contents

**description**

The description of the disk image being imported.

Type: String

Required: No

**diskImageSize**

The size of the disk in the snapshot, in GiB.

Type: Double

Required: No

**encrypted**

Indicates whether the snapshot is encrypted.

Type: Boolean

Required: No

**format**

The format of the disk image from which the snapshot is created.

Type: String

Required: No

**kmsKeyId**

The identifier for the KMS key that was used to create the encrypted snapshot.

Type: String

Required: No

**progress**

The percentage of completion for the import snapshot task.

Type: String

Required: No

**snapshotId**

The snapshot ID of the disk being imported.

Type: String

Required: No

**status**

A brief status for the import snapshot task.

Type: String

Required: No

**statusMessage**

A detailed status message for the import snapshot task.

Type: String

Required: No

**url**

The URL of the disk image from which the snapshot is created.

Type: String

Required: No

**userBucket**

The Amazon S3 bucket for the disk image.

Type: UserBucketDetails object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SnapshotTierStatus

Provides information about a snapshot's storage tier.

## Contents

**archivalCompleteTime**

The date and time when the last archive process was completed.

Type: Timestamp

Required: No

**lastTieringOperationStatus**

The status of the last archive or restore process.

Type: String

Valid Values: `archival-in-progress | archival-completed | archival-failed | temporary-restore-in-progress | temporary-restore-completed | temporary-restore-failed | permanent-restore-in-progress | permanent-restore-completed | permanent-restore-failed`

Required: No

**lastTieringOperationStatusDetail**

A message describing the status of the last archive or restore process.

Type: String

Required: No

**lastTieringProgress**

The progress of the last archive or restore process, as a percentage.

Type: Integer

Required: No

**lastTieringStartTime**

The date and time when the last archive or restore process was started.

Type: Timestamp

Required: No

**ownerId**

The ID of the AWS account that owns the snapshot.

Type: String

Required: No

**restoreExpiryTime**

Only for archived snapshots that are temporarily restored. Indicates the date and time when a temporarily restored snapshot will be automatically re-archived.

Type: Timestamp

Required: No

**snapshotId**

The ID of the snapshot.

Type: String

Required: No

**status**

The state of the snapshot.

Type: String

Valid Values: `pending | completed | error | recoverable | recovering`

Required: No

**storageTier**

The storage tier in which the snapshot is stored. `standard` indicates that the snapshot is stored in the standard snapshot storage tier and that it is ready for use. `archive` indicates that the snapshot is currently archived and that it must be restored before it can be used.

Type: String

Valid Values: `archive | standard`

Required: No

**TagSet.N**

The tags that are assigned to the snapshot.

Type: Array of Tag objects

Required: No

**volumeId**

The ID of the volume from which the snapshot was created.

Type: String

Required: No

## See Also

- AWS SDK for Ruby V3

# SpotCapacityRebalance

The Spot Instance replacement strategy to use when Amazon EC2 emits a signal that your Spot Instance is at an elevated risk of being interrupted. For more information, see Capacity rebalancing in the *Amazon EC2 User Guide*.

## Contents

**ReplacementStrategy** (request), **replacementStrategy** (response)

The replacement strategy to use. Only available for fleets of type `maintain`.

`launch` - Spot Fleet launches a new replacement Spot Instance when a rebalance notification is emitted for an existing Spot Instance in the fleet. Spot Fleet does not terminate the instances that receive a rebalance notification. You can terminate the old instances, or you can leave them running. You are charged for all instances while they are running.

`launch-before-terminate` - Spot Fleet launches a new replacement Spot Instance when a rebalance notification is emitted for an existing Spot Instance in the fleet, and then, after a delay that you specify (in `TerminationDelay`), terminates the instances that received a rebalance notification.

Type: String

Valid Values: `launch | launch-before-terminate`

Required: No

**TerminationDelay** (request), **terminationDelay** (response)

The amount of time (in seconds) that Amazon EC2 waits before terminating the old Spot Instance after launching a new replacement Spot Instance.

Required when `ReplacementStrategy` is set to `launch-before-terminate`.

Not valid when `ReplacementStrategy` is set to `launch`.

Valid values: Minimum value of `120` seconds. Maximum value of `7200` seconds.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotDatafeedSubscription

Describes the data feed for a Spot Instance.

## Contents

**bucket**

The name of the Amazon S3 bucket where the Spot Instance data feed is located.

Type: String

Required: No

**fault**

The fault codes for the Spot Instance request, if any.

Type: SpotInstanceStateFault object

Required: No

**ownerId**

The AWS account ID of the account.

Type: String

Required: No

**prefix**

The prefix for the data feed files.

Type: String

Required: No

**state**

The state of the Spot Instance data feed subscription.

Type: String

Valid Values: `Active | Inactive`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotFleetLaunchSpecification

Describes the launch specification for one or more Spot Instances. If you include On-Demand capacity in your fleet request or want to specify an EFA network device, you can't use `SpotFleetLaunchSpecification`; you must use LaunchTemplateConfig.

## Contents

**AddressingType** (request), **addressingType** (response)

Deprecated.

Type: String

Required: No

**BlockDeviceMapping.N**

One or more block devices that are mapped to the Spot Instances. You can't specify both a snapshot ID and an encryption value. This is because only blank volumes can be encrypted on creation. If a snapshot is the basis for a volume, it is not blank and its encryption status is used for the volume encryption status.

Type: Array of BlockDeviceMapping objects

Required: No

**EbsOptimized** (request), **ebsOptimized** (response)

Indicates whether the instances are optimized for EBS I/O. This optimization provides dedicated throughput to Amazon EBS and an optimized configuration stack to provide optimal EBS I/O performance. This optimization isn't available with all instance types. Additional usage charges apply when using an EBS Optimized instance.

Default: `false`

Type: Boolean

Required: No

**GroupSet.N**

The security groups.

If you specify a network interface, you must specify any security groups as part of the network interface instead of using this parameter.

Type: Array of GroupIdentifier objects

Required: No

**IamInstanceProfile** (request), **iamInstanceProfile** (response)

The IAM instance profile.

Type: IamInstanceProfileSpecification object

Required: No

**ImageId** (request), **imageId** (response)

The ID of the AMI.

Type: String

Required: No

**InstanceRequirements** (request), **instanceRequirements** (response)

The attributes for the instance types. When you specify instance attributes, Amazon EC2 will identify instance types with those attributes.

> **Note**
>
> If you specify `InstanceRequirements`, you can't specify `InstanceType`.

Type: InstanceRequirements object

Required: No

**InstanceType** (request), **instanceType** (response)

The instance type.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge |`

c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge | c5ad.2xlarge | c5ad.4xlarge | c5ad.8xlarge | c5ad.12xlarge | c5ad.16xlarge | c5ad.24xlarge | c5d.large | c5d.xlarge | c5d.2xlarge | c5d.4xlarge | c5d.9xlarge | c5d.12xlarge | c5d.18xlarge | c5d.24xlarge | c5d.metal | c5n.large | c5n.xlarge | c5n.2xlarge | c5n.4xlarge | c5n.9xlarge | c5n.18xlarge | c5n.metal | c6g.medium | c6g.large | c6g.xlarge | c6g.2xlarge | c6g.4xlarge | c6g.8xlarge | c6g.12xlarge | c6g.16xlarge | c6g.metal | c6gd.medium | c6gd.large | c6gd.xlarge | c6gd.2xlarge | c6gd.4xlarge | c6gd.8xlarge | c6gd.12xlarge | c6gd.16xlarge | c6gd.metal | c6gn.medium | c6gn.large | c6gn.xlarge | c6gn.2xlarge | c6gn.4xlarge | c6gn.8xlarge | c6gn.12xlarge | c6gn.16xlarge | c6i.large | c6i.xlarge | c6i.2xlarge | c6i.4xlarge | c6i.8xlarge | c6i.12xlarge | c6i.16xlarge | c6i.24xlarge | c6i.32xlarge | c6i.metal | cc1.4xlarge | cc2.8xlarge | cg1.4xlarge | cr1.8xlarge | d2.xlarge | d2.2xlarge | d2.4xlarge | d2.8xlarge | d3.xlarge | d3.2xlarge | d3.4xlarge | d3.8xlarge | d3en.xlarge | d3en.2xlarge | d3en.4xlarge | d3en.6xlarge | d3en.8xlarge | d3en.12xlarge | dl1.24xlarge | f1.2xlarge | f1.4xlarge | f1.16xlarge | g2.2xlarge | g2.8xlarge | g3.4xlarge | g3.8xlarge | g3.16xlarge | g3s.xlarge | g4ad.xlarge | g4ad.2xlarge | g4ad.4xlarge | g4ad.8xlarge | g4ad.16xlarge | g4dn.xlarge | g4dn.2xlarge | g4dn.4xlarge | g4dn.8xlarge | g4dn.12xlarge | g4dn.16xlarge | g4dn.metal | g5.xlarge | g5.2xlarge | g5.4xlarge | g5.8xlarge | g5.12xlarge | g5.16xlarge | g5.24xlarge | g5.48xlarge | g5g.xlarge | g5g.2xlarge | g5g.4xlarge | g5g.8xlarge | g5g.16xlarge | g5g.metal | hi1.4xlarge | hpc6a.48xlarge | hs1.8xlarge | h1.2xlarge | h1.4xlarge | h1.8xlarge | h1.16xlarge | i2.xlarge | i2.2xlarge | i2.4xlarge | i2.8xlarge | i3.large | i3.xlarge | i3.2xlarge | i3.4xlarge | i3.8xlarge | i3.16xlarge | i3.metal | i3en.large | i3en.xlarge | i3en.2xlarge | i3en.3xlarge | i3en.6xlarge | i3en.12xlarge | i3en.24xlarge | i3en.metal | im4gn.large | im4gn.xlarge | im4gn.2xlarge | im4gn.4xlarge | im4gn.8xlarge | im4gn.16xlarge | inf1.xlarge | inf1.2xlarge | inf1.6xlarge | inf1.24xlarge | is4gen.medium | is4gen.large | is4gen.xlarge | is4gen.2xlarge |

Required: No

**KernelId** (request), **kernelId** (response)

The ID of the kernel.

Type: String

Required: No

**KeyName** (request), **keyName** (response)

The name of the key pair.

Type: String

Required: No

**Monitoring** (request), **monitoring** (response)

Enable or disable monitoring for the instances.

Type: SpotFleetMonitoring object

Required: No

**NetworkInterfaceSet.N**

The network interfaces.

> **Note**
>
> `SpotFleetLaunchSpecification` does not support Elastic Fabric Adapter (EFA). You must use LaunchTemplateConfig instead.

Type: Array of InstanceNetworkInterfaceSpecification objects

Required: No

**Placement** (request), **placement** (response)

The placement information.

Type: SpotPlacement object

Required: No

**RamdiskId** (request), **ramdiskId** (response)

The ID of the RAM disk. Some kernels require additional drivers at launch. Check the kernel requirements for information about whether you need to specify a RAM disk. To find kernel requirements, refer to the AWS Resource Center and search for the kernel ID.

Type: String

Required: No

**SpotPrice** (request), **spotPrice** (response)

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.

Type: String

Required: No

**SubnetId** (request), **subnetId** (response)

The IDs of the subnets in which to launch the instances. To specify multiple subnets, separate them using commas; for example, "subnet-1234abcdeexample1, subnet-0987cdef6example2".

If you specify a network interface, you must specify any subnets as part of the network interface instead of using this parameter.

Type: String

Required: No

**TagSpecificationSet.N**

The tags to apply during creation.

Type: Array of SpotFleetTagSpecification objects

Required: No

**UserData** (request), **userData** (response)

The base64-encoded user data that instances use when starting up. User data is limited to 16 KB.

Type: String

Required: No

**WeightedCapacity** (request), **weightedCapacity** (response)

The number of units provided by the specified instance type. These are the same units that you chose to set the target capacity in terms of instances, or a performance characteristic such as vCPUs, memory, or I/O.

If the target capacity divided by this value is not a whole number, Amazon EC2 rounds the number of instances to the next whole number. If this value is not specified, the default is 1.

> **Note**
>
> When specifying weights, the price used in the `lowestPrice` and `priceCapacityOptimized` allocation strategies is per *unit* hour (where the instance price is divided by the specified weight). However, if all the specified weights are above the requested `TargetCapacity`, resulting in only 1 instance being launched, the price used is per *instance* hour.

Type: Double

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotFleetMonitoring

Describes whether monitoring is enabled.

## Contents

**Enabled** (request), **enabled** (response)

Enables monitoring for the instance.

Default: `false`

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotFleetRequestConfig

Describes a Spot Fleet request.

## Contents

**activityStatus**

The progress of the Spot Fleet request. If there is an error, the status is `error`. After all requests are placed, the status is `pending_fulfillment`. If the size of the fleet is equal to or greater than its target capacity, the status is `fulfilled`. If the size of the fleet is decreased, the status is `pending_termination` while Spot Instances are terminating.

Type: String

Valid Values: `error | pending_fulfillment | pending_termination | fulfilled`

Required: No

**createTime**

The creation date and time of the request.

Type: Timestamp

Required: No

**spotFleetRequestConfig**

The configuration of the Spot Fleet request.

Type: SpotFleetRequestConfigData object

Required: No

**spotFleetRequestId**

The ID of the Spot Fleet request.

Type: String

Required: No

**spotFleetRequestState**

The state of the Spot Fleet request.

Type: String

Valid Values: `submitted | active | cancelled | failed | cancelled_running | cancelled_terminating | modifying`

Required: No

**TagSet.N**

The tags for a Spot Fleet resource.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotFleetRequestConfigData

Describes the configuration of a Spot Fleet request.

## Contents

**IamFleetRole** (request), **iamFleetRole** (response)

The Amazon Resource Name (ARN) of an AWS Identity and Access Management (IAM) role that grants the Spot Fleet the permission to request, launch, terminate, and tag instances on your behalf. For more information, see Spot Fleet prerequisites in the *Amazon EC2 User Guide*. Spot Fleet can terminate Spot Instances on your behalf when you cancel its Spot Fleet request using CancelSpotFleetRequests or when the Spot Fleet request expires, if you set `TerminateInstancesWithExpiration`.

Type: String

Required: Yes

**TargetCapacity** (request), **targetCapacity** (response)

The number of units to request for the Spot Fleet. You can choose to set the target capacity in terms of instances or a performance characteristic that is important to your application workload, such as vCPUs, memory, or I/O. If the request type is `maintain`, you can specify a target capacity of 0 and add capacity later.

Type: Integer

Required: Yes

**AllocationStrategy** (request), **allocationStrategy** (response)

The strategy that determines how to allocate the target Spot Instance capacity across the Spot Instance pools specified by the Spot Fleet launch configuration. For more information, see Allocation strategies for Spot Instances in the *Amazon EC2 User Guide*.

priceCapacityOptimized (recommended)

Spot Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. Spot Fleet then requests Spot Instances from the lowest priced of these pools.

capacityOptimized

Spot Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. To give certain instance types a higher chance of launching first, use `capacityOptimizedPrioritized`. Set a priority for each instance type by using the `Priority` parameter for `LaunchTemplateOverrides`. You can assign the same priority to different `LaunchTemplateOverrides`. EC2 implements the priorities on a best-effort basis, but optimizes for capacity first. `capacityOptimizedPrioritized` is supported only if your Spot Fleet uses a launch template. Note that if the `OnDemandAllocationStrategy` is set to `prioritized`, the same priority is applied when fulfilling On-Demand capacity.

diversified

Spot Fleet requests instances from all of the Spot Instance pools that you specify.

lowestPrice (not recommended)

> **Important**
>
> We don't recommend the `lowestPrice` allocation strategy because it has the highest risk of interruption for your Spot Instances.

Spot Fleet requests instances from the lowest priced Spot Instance pool that has available capacity. If the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity. If a pool runs out of capacity before fulfilling your desired capacity, Spot Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools. Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

Default: `lowestPrice`

Type: String

Valid Values: `lowestPrice | diversified | capacityOptimized | capacityOptimizedPrioritized | priceCapacityOptimized`

Required: No

**ClientToken** (request), **clientToken** (response)

A unique, case-sensitive identifier that you provide to ensure the idempotency of your listings. This helps to avoid duplicate listings. For more information, see Ensuring Idempotency.

Type: String

Required: No

**Context** (request), **context** (response)

Reserved.

Type: String

Required: No

**ExcessCapacityTerminationPolicy** (request), **excessCapacityTerminationPolicy** (response)

Indicates whether running instances should be terminated if you decrease the target capacity of the Spot Fleet request below the current size of the Spot Fleet.

Supported only for fleets of type `maintain`.

Type: String

Valid Values: `noTermination | default`

Required: No

**FulfilledCapacity** (request), **fulfilledCapacity** (response)

The number of units fulfilled by this request compared to the set target capacity. You cannot set this value.

Type: Double

Required: No

**InstanceInterruptionBehavior** (request), **instanceInterruptionBehavior** (response)

The behavior when a Spot Instance is interrupted. The default is `terminate`.

Type: String

Valid Values: `hibernate | stop | terminate`

Required: No

**InstancePoolsToUseCount** (request), **instancePoolsToUseCount** (response)

The number of Spot pools across which to allocate your target Spot capacity. Valid only when Spot **AllocationStrategy** is set to `lowest-price`. Spot Fleet selects the cheapest Spot pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that Spot Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, Spot Fleet will continue to fulfill your request by drawing from the next cheapest pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Type: Integer

Required: No

**LaunchSpecifications.N**

The launch specifications for the Spot Fleet request. If you specify `LaunchSpecifications`, you can't specify `LaunchTemplateConfigs`. If you include On-Demand capacity in your request, you must use `LaunchTemplateConfigs`.

> **Note**
>
> If an AMI specified in a launch specification is deregistered or disabled, no new instances can be launched from the AMI. For fleets of type `maintain`, the target capacity will not be maintained.

Type: Array of SpotFleetLaunchSpecification objects

Required: No

**LaunchTemplateConfigs.N**

The launch template and overrides. If you specify `LaunchTemplateConfigs`, you can't specify `LaunchSpecifications`. If you include On-Demand capacity in your request, you must use `LaunchTemplateConfigs`.

Type: Array of LaunchTemplateConfig objects

Required: No

**LoadBalancersConfig** (request), **loadBalancersConfig** (response)

One or more Classic Load Balancers and target groups to attach to the Spot Fleet request. Spot Fleet registers the running Spot Instances with the specified Classic Load Balancers and target groups.

With Network Load Balancers, Spot Fleet cannot register instances that have the following instance types: C1, CC1, CC2, CG1, CG2, CR1, CS1, G1, G2, HI1, HS1, M1, M2, M3, and T1.

Type: LoadBalancersConfig object

Required: No

**OnDemandAllocationStrategy** (request), **onDemandAllocationStrategy** (response)

The order of the launch template overrides to use in fulfilling On-Demand capacity. If you specify `lowestPrice`, Spot Fleet uses price to determine the order, launching the lowest price first. If you specify `prioritized`, Spot Fleet uses the priority that you assign to each Spot Fleet launch template override, launching the highest priority first. If you do not specify a value, Spot Fleet defaults to `lowestPrice`.

Type: String

Valid Values: `lowestPrice | prioritized`

Required: No

**OnDemandFulfilledCapacity** (request), **onDemandFulfilledCapacity** (response)

The number of On-Demand units fulfilled by this request compared to the set target On-Demand capacity.

Type: Double

Required: No

**OnDemandMaxTotalPrice** (request), **onDemandMaxTotalPrice** (response)

The maximum amount per hour for On-Demand Instances that you're willing to pay. You can use the `onDemandMaxTotalPrice` parameter, the `spotMaxTotalPrice` parameter, or both parameters to ensure that your fleet cost does not exceed your budget. If you set a maximum

price per hour for the On-Demand Instances and Spot Instances in your request, Spot Fleet will launch instances until it reaches the maximum amount you're willing to pay. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

> **Note**
>
> If your fleet includes T instances that are configured as `unlimited`, and if their average CPU usage exceeds the baseline utilization, you will incur a charge for surplus credits. The `onDemandMaxTotalPrice` does not account for surplus credits, and, if you use surplus credits, your final cost might be higher than what you specified for `onDemandMaxTotalPrice`. For more information, see Surplus credits can incur charges in the *Amazon EC2 User Guide*.

Type: String

Required: No

**OnDemandTargetCapacity** (request), **onDemandTargetCapacity** (response)

The number of On-Demand units to request. You can choose to set the target capacity in terms of instances or a performance characteristic that is important to your application workload, such as vCPUs, memory, or I/O. If the request type is `maintain`, you can specify a target capacity of 0 and add capacity later.

Type: Integer

Required: No

**ReplaceUnhealthyInstances** (request), **replaceUnhealthyInstances** (response)

Indicates whether Spot Fleet should replace unhealthy instances.

Type: Boolean

Required: No

**SpotMaintenanceStrategies** (request), **spotMaintenanceStrategies** (response)

The strategies for managing your Spot Instances that are at an elevated risk of being interrupted.

Type: SpotMaintenanceStrategies object

Required: No

**SpotMaxTotalPrice** (request), **spotMaxTotalPrice** (response)

The maximum amount per hour for Spot Instances that you're willing to pay. You can use the `spotMaxTotalPrice` parameter, the `onDemandMaxTotalPrice` parameter, or both parameters to ensure that your fleet cost does not exceed your budget. If you set a maximum price per hour for the On-Demand Instances and Spot Instances in your request, Spot Fleet will launch instances until it reaches the maximum amount you're willing to pay. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity.

> **Note**
>
> If your fleet includes T instances that are configured as `unlimited`, and if their average CPU usage exceeds the baseline utilization, you will incur a charge for surplus credits. The `spotMaxTotalPrice` does not account for surplus credits, and, if you use surplus credits, your final cost might be higher than what you specified for `spotMaxTotalPrice`. For more information, see Surplus credits can incur charges in the *Amazon EC2 User Guide*.

Type: String

Required: No

**SpotPrice** (request), **spotPrice** (response)

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.

Type: String

Required: No

**TagSpecification.N**

The key-value pair for tagging the Spot Fleet request on creation. The value for `ResourceType` must be `spot-fleet-request`, otherwise the Spot Fleet request fails. To tag instances at launch, specify the tags in the launch template (valid only if you use `LaunchTemplateConfigs`) or in the `SpotFleetTagSpecification` (valid only if you use `LaunchSpecifications`). For information about tagging after launch, see Tag your resources.

Type: Array of TagSpecification objects

Required: No

**TargetCapacityUnitType** (request), **targetCapacityUnitType** (response)

The unit for the target capacity. You can specify this parameter only when using attribute-based instance type selection.

Default: `units` (the number of instances)

Type: String

Valid Values: `vcpu | memory-mib | units`

Required: No

**TerminateInstancesWithExpiration** (request), **terminateInstancesWithExpiration** (response)

Indicates whether running Spot Instances are terminated when the Spot Fleet request expires.

Type: Boolean

Required: No

**Type** (request), **type** (response)

The type of request. Indicates whether the Spot Fleet only requests the target capacity or also attempts to maintain it. When this value is `request`, the Spot Fleet only places the required requests. It does not attempt to replenish Spot Instances if capacity is diminished, nor does it submit requests in alternative Spot pools if capacity is not available. When this value is `maintain`, the Spot Fleet maintains the target capacity. The Spot Fleet places the required requests to meet capacity and automatically replenishes any interrupted instances. Default: `maintain`. `instant` is listed but is not used by Spot Fleet.

Type: String

Valid Values: `request | maintain | instant`

Required: No

**ValidFrom** (request), **validFrom** (response)

The start date and time of the request, in UTC format (*YYYY-MM-DD*T*HH*:*MM*:*SS*Z). By default, Amazon EC2 starts fulfilling the request immediately.

Type: Timestamp

Required: No

**ValidUntil** (request), **validUntil** (response)

The end date and time of the request, in UTC format (*YYYY-MM-DD*T*HH*:*MM*:*SS*Z). After the end date and time, no new Spot Instance requests are placed or able to fulfill the request. If no value is specified, the Spot Fleet request remains until you cancel it.

Type: Timestamp

Required: No

# SpotFleetTagSpecification

The tags for a Spot Fleet resource.

## Contents

**ResourceType** (request), **resourceType** (response)

The type of resource. Currently, the only resource type that is supported is `instance`. To tag the Spot Fleet request on creation, use the `TagSpecifications` parameter in `SpotFleetRequestConfigData` .

Type: String

Valid Values: `capacity-reservation | client-vpn-endpoint | customer-gateway | carrier-gateway | coip-pool | declarative-policies-report | dedicated-host | dhcp-options | egress-only-internet-gateway | elastic-ip | elastic-gpu | export-image-task | export-instance-task | fleet | fpga-image | host-reservation | image | image-usage-report | import-image-task | import-snapshot-task | instance | instance-event-window | internet-gateway | ipam | ipam-pool | ipam-scope | ipv4pool-ec2 | ipv6pool-ec2 | key-pair | launch-template | local-gateway | local-gateway-route-table | local-gateway-virtual-interface | local-gateway-virtual-interface-group | local-gateway-route-table-vpc-association | local-gateway-route-table-virtual-interface-group-association | natgateway | network-acl | network-interface | network-insights-analysis | network-insights-path | network-insights-access-scope | network-insights-access-scope-analysis | outpost-lag | placement-group | prefix-list | replace-root-volume-task | reserved-instances | route-table | security-group | security-group-rule | service-link-virtual-interface | snapshot | spot-fleet-request | spot-instances-request | subnet | subnet-cidr-reservation | traffic-mirror-filter | traffic-mirror-session | traffic-mirror-target | transit-gateway | transit-gateway-attachment | transit-gateway-connect-peer | transit-gateway-multicast-domain | transit-gateway-policy-table | transit-gateway-metering-policy | transit-gateway-route-table | transit-gateway-route-table-announcement | volume | vpc | vpc-endpoint | vpc-endpoint-connection | vpc-endpoint-service | vpc-endpoint-service-permission | vpc-peering-connection |`

`vpn-connection | vpn-gateway | vpc-flow-log | capacity-reservation-fleet | traffic-mirror-filter-rule | vpc-endpoint-connection-device-type | verified-access-instance | verified-access-group | verified-access-endpoint | verified-access-policy | verified-access-trust-provider | vpn-connection-device-type | vpc-block-public-access-exclusion | vpc-encryption-control | route-server | route-server-endpoint | route-server-peer | ipam-resource-discovery | ipam-resource-discovery-association | instance-connect-endpoint | verified-access-endpoint-target | ipam-external-resource-verification-token | capacity-block | mac-modification-task | ipam-prefix-list-resolver | ipam-policy | ipam-prefix-list-resolver-target | secondary-interface | secondary-network | secondary-subnet | capacity-manager-data-export | vpn-concentrator | ipam-pool-allocation | capacity-reservation-cancellation-quote`

Required: No

**Tag.N**

The tags.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

# SpotInstanceRequest

Describes a Spot Instance request.

## Contents

**actualBlockHourlyPrice**

Deprecated.

Type: String

Required: No

**availabilityZoneGroup**

The Availability Zone group. If you specify the same Availability Zone group for all Spot Instance requests, all Spot Instances are launched in the same Availability Zone.

Type: String

Required: No

**blockDurationMinutes**

Deprecated.

Type: Integer

Required: No

**createTime**

The date and time when the Spot Instance request was created, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: No

**fault**

The fault codes for the Spot Instance request, if any.

Type: SpotInstanceStateFault object

Required: No

**instanceId**

The instance ID, if an instance has been launched to fulfill the Spot Instance request.

Type: String

Required: No

**instanceInterruptionBehavior**

The behavior when a Spot Instance is interrupted.

Type: String

Valid Values: `hibernate | stop | terminate`

Required: No

**launchedAvailabilityZone**

The Availability Zone in which the request is launched.

Either `launchedAvailabilityZone` or `launchedAvailabilityZoneId` can be specified, but not both

Type: String

Required: No

**launchedAvailabilityZoneId**

The ID of the Availability Zone in which the request is launched.

Either `launchedAvailabilityZone` or `launchedAvailabilityZoneId` can be specified, but not both

Type: String

Required: No

**launchGroup**

The instance launch group. Launch groups are Spot Instances that launch together and terminate together.

Type: String

Required: No

**launchSpecification**

Additional information for launching instances.

Type: LaunchSpecification object

Required: No

**productDescription**

The product description associated with the Spot Instance.

Type: String

Valid Values: `Linux/UNIX | Linux/UNIX (Amazon VPC) | Windows | Windows (Amazon VPC)`

Required: No

**spotInstanceRequestId**

The ID of the Spot Instance request.

Type: String

Required: No

**spotPrice**

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.

Type: String

Required: No

**state**

The state of the Spot Instance request. Spot request status information helps track your Spot Instance requests. For more information, see Spot request status in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `open | active | closed | cancelled | failed`

Required: No

**status**

The status code and status message describing the Spot Instance request.

Type: SpotInstanceStatus object

Required: No

**TagSet.N**

Any tags assigned to the resource.

Type: Array of Tag objects

Required: No

**type**

The Spot Instance request type.

Type: String

Valid Values: `one-time | persistent`

Required: No

**validFrom**

The start date of the request, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z). The request becomes active at this date and time.

Type: Timestamp

Required: No

**validUntil**

The end date of the request, in UTC format (*YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

- For a persistent request, the request remains active until the `validUntil` date and time is reached. Otherwise, the request remains active until you cancel it.
- For a one-time request, the request remains active until all instances launch, the request is canceled, or the `validUntil` date and time is reached. By default, the request is valid for 7 days from the date the request was created.

Type: Timestamp

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotInstanceStateFault

Describes a Spot Instance state change.

## Contents

**code**

The reason code for the Spot Instance state change.

Type: String

Required: No

**message**

The message for the Spot Instance state change.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotInstanceStatus

Describes the status of a Spot Instance request.

## Contents

**code**

The status code. For a list of status codes, see Spot request status codes in the *Amazon EC2 User Guide*.

Type: String

Required: No

**message**

The description for the status code.

Type: String

Required: No

**updateTime**

The date and time of the most recent status update, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotMaintenanceStrategies

The strategies for managing your Spot Instances that are at an elevated risk of being interrupted.

## Contents

**CapacityRebalance** (request), **capacityRebalance** (response)

The Spot Instance replacement strategy to use when Amazon EC2 emits a signal that your Spot Instance is at an elevated risk of being interrupted. For more information, see Capacity rebalancing in the *Amazon EC2 User Guide*.

Type: SpotCapacityRebalance object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotMarketOptions

The options for Spot Instances.

## Contents

**BlockDurationMinutes**

Deprecated.

Type: Integer

Required: No

**InstanceInterruptionBehavior**

The behavior when a Spot Instance is interrupted.

If `Configured` (for `HibernationOptions`) is set to `true`, the `InstanceInterruptionBehavior` parameter is automatically set to `hibernate`. If you set it to `stop` or `terminate`, you'll get an error.

If `Configured` (for `HibernationOptions`) is set to `false` or `null`, the `InstanceInterruptionBehavior` parameter is automatically set to `terminate`. You can also set it to `stop` or `hibernate`.

For more information, see Interruption behavior in the *Amazon EC2 User Guide*.

Type: String

Valid Values: `hibernate | stop | terminate`

Required: No

**MaxPrice**

The maximum hourly price that you're willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your Spot Instances will be interrupted more frequently than if you do not specify this parameter.

If you specify a maximum price, it must be more than USD $0.001. Specifying a value below USD $0.001 will result in an `InvalidParameterValue` error message.

Type: String

Required: No

**SpotInstanceType**

The Spot Instance request type. For RunInstances, persistent Spot Instance requests are only supported when the instance interruption behavior is either `hibernate` or `stop`.

Type: String

Valid Values: `one-time | persistent`

Required: No

**ValidUntil**

The end date of the request, in UTC format (*YYYY-MM-DD*T*HH*:*MM*:*SS*Z). Supported only for persistent requests.

- For a persistent request, the request remains active until the `ValidUntil` date and time is reached. Otherwise, the request remains active until you cancel it.
- For a one-time request, `ValidUntil` is not supported. The request remains active until all instances launch or you cancel the request.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotOptions

Describes the configuration of Spot Instances in an EC2 Fleet.

## Contents

**allocationStrategy**

The strategy that determines how to allocate the target Spot Instance capacity across the Spot Instance pools specified by the EC2 Fleet launch configuration. For more information, see Allocation strategies for Spot Instances in the *Amazon EC2 User Guide*.

price-capacity-optimized (recommended)

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. EC2 Fleet then requests Spot Instances from the lowest priced of these pools.

capacity-optimized

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. To give certain instance types a higher chance of launching first, use `capacity-optimized-prioritized`. Set a priority for each instance type by using the `Priority` parameter for `LaunchTemplateOverrides`. You can assign the same priority to different `LaunchTemplateOverrides`. EC2 implements the priorities on a best-effort basis, but optimizes for capacity first. `capacity-optimized-prioritized` is supported only if your EC2 Fleet uses a launch template. Note that if the On-Demand `AllocationStrategy` is set to `prioritized`, the same priority is applied when fulfilling On-Demand capacity.

diversified

EC2 Fleet requests instances from all of the Spot Instance pools that you specify.

lowest-price (not recommended)

> **Important**
>
> We don't recommend the `lowest-price` allocation strategy because it has the highest risk of interruption for your Spot Instances.

EC2 Fleet requests instances from the lowest priced Spot Instance pool that has available capacity. If the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity. If a pool runs out of capacity before fulfilling your desired capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools. Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

Default: `lowest-price`

Type: String

Valid Values: `lowest-price | diversified | capacity-optimized | capacity-optimized-prioritized | price-capacity-optimized`

Required: No

**instanceInterruptionBehavior**

The behavior when a Spot Instance is interrupted.

Default: `terminate`

Type: String

Valid Values: `hibernate | stop | terminate`

Required: No

**instancePoolsToUseCount**

The number of Spot pools across which to allocate your target Spot capacity. Supported only when `AllocationStrategy` is set to `lowest-price`. EC2 Fleet selects the cheapest Spot pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that EC2 Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, EC2 Fleet will continue to fulfill your request by drawing from the next cheapest pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Type: Integer

Required: No

**maintenanceStrategies**

The strategies for managing your workloads on your Spot Instances that will be interrupted. Currently only the capacity rebalance strategy is available.

Type: FleetSpotMaintenanceStrategies object

Required: No

**maxTotalPrice**

The maximum amount per hour for Spot Instances that you're willing to pay. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your Spot Instances will be interrupted more frequently than if you do not specify this parameter.

> **Note**
>
> If your fleet includes T instances that are configured as `unlimited`, and if their average CPU usage exceeds the baseline utilization, you will incur a charge for surplus credits. The `maxTotalPrice` does not account for surplus credits, and, if you use surplus credits, your final cost might be higher than what you specified for `maxTotalPrice`. For more information, see Surplus credits can incur charges in the *Amazon EC2 User Guide*.

Type: String

Required: No

**minTargetCapacity**

The minimum target capacity for Spot Instances in the fleet. If this minimum capacity isn't reached, no instances are launched.

Constraints: Maximum value of `1000`. Supported only for fleets of type `instant`.

At least one of the following must be specified: `SingleAvailabilityZone` | `SingleInstanceType`

Type: Integer

Required: No

**singleAvailabilityZone**

Indicates that the fleet launches all Spot Instances into a single Availability Zone.

Supported only for fleets of type `instant`.

Type: Boolean

Required: No

**singleInstanceType**

Indicates that the fleet uses a single instance type to launch all Spot Instances in the fleet.

Supported only for fleets of type `instant`.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotOptionsRequest

Describes the configuration of Spot Instances in an EC2 Fleet request.

## Contents

### AllocationStrategy

The strategy that determines how to allocate the target Spot Instance capacity across the Spot Instance pools specified by the EC2 Fleet launch configuration. For more information, see Allocation strategies for Spot Instances in the *Amazon EC2 User Guide*.

price-capacity-optimized (recommended)

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. EC2 Fleet then requests Spot Instances from the lowest priced of these pools.

capacity-optimized

EC2 Fleet identifies the pools with the highest capacity availability for the number of instances that are launching. This means that we will request Spot Instances from the pools that we believe have the lowest chance of interruption in the near term. To give certain instance types a higher chance of launching first, use `capacity-optimized-prioritized`. Set a priority for each instance type by using the `Priority` parameter for `LaunchTemplateOverrides`. You can assign the same priority to different `LaunchTemplateOverrides`. EC2 implements the priorities on a best-effort basis, but optimizes for capacity first. `capacity-optimized-prioritized` is supported only if your EC2 Fleet uses a launch template. Note that if the On-Demand `AllocationStrategy` is set to `prioritized`, the same priority is applied when fulfilling On-Demand capacity.

diversified

EC2 Fleet requests instances from all of the Spot Instance pools that you specify.

lowest-price (not recommended)

> **Important**
>
> We don't recommend the `lowest-price` allocation strategy because it has the highest risk of interruption for your Spot Instances.

EC2 Fleet requests instances from the lowest priced Spot Instance pool that has available capacity. If the lowest priced pool doesn't have available capacity, the Spot Instances come from the next lowest priced pool that has available capacity. If a pool runs out of capacity before fulfilling your desired capacity, EC2 Fleet will continue to fulfill your request by drawing from the next lowest priced pool. To ensure that your desired capacity is met, you might receive Spot Instances from several pools. Because this strategy only considers instance price and not capacity availability, it might lead to high interruption rates.

Default: `lowest-price`

Type: String

Valid Values: `lowest-price | diversified | capacity-optimized | capacity-optimized-prioritized | price-capacity-optimized`

Required: No

**InstanceInterruptionBehavior**

The behavior when a Spot Instance is interrupted.

Default: `terminate`

Type: String

Valid Values: `hibernate | stop | terminate`

Required: No

**InstancePoolsToUseCount**

The number of Spot pools across which to allocate your target Spot capacity. Supported only when Spot `AllocationStrategy` is set to `lowest-price`. EC2 Fleet selects the cheapest Spot pools and evenly allocates your target Spot capacity across the number of Spot pools that you specify.

Note that EC2 Fleet attempts to draw Spot Instances from the number of pools that you specify on a best effort basis. If a pool runs out of Spot capacity before fulfilling your target capacity, EC2 Fleet will continue to fulfill your request by drawing from the next cheapest pool. To ensure that your target capacity is met, you might receive Spot Instances from more than the number of pools that you specified. Similarly, if most of the pools have no Spot capacity, you might receive your full target capacity from fewer than the number of pools that you specified.

Type: Integer

Required: No

**MaintenanceStrategies**

The strategies for managing your Spot Instances that are at an elevated risk of being interrupted.

Type: FleetSpotMaintenanceStrategiesRequest object

Required: No

**MaxTotalPrice**

The maximum amount per hour for Spot Instances that you're willing to pay. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your Spot Instances will be interrupted more frequently than if you do not specify this parameter.

> **Note**
>
> If your fleet includes T instances that are configured as `unlimited`, and if their average CPU usage exceeds the baseline utilization, you will incur a charge for surplus credits. The `MaxTotalPrice` does not account for surplus credits, and, if you use surplus credits, your final cost might be higher than what you specified for `MaxTotalPrice`. For more information, see Surplus credits can incur charges in the *Amazon EC2 User Guide*.

Type: String

Required: No

**MinTargetCapacity**

The minimum target capacity for Spot Instances in the fleet. If this minimum capacity isn't reached, no instances are launched.

Constraints: Maximum value of `1000`. Supported only for fleets of type `instant`.

At least one of the following must be specified: `SingleAvailabilityZone` | `SingleInstanceType`

Type: Integer

Required: No

**SingleAvailabilityZone**

Indicates that the fleet launches all Spot Instances into a single Availability Zone.

Supported only for fleets of type `instant`.

Type: Boolean

Required: No

**SingleInstanceType**

Indicates that the fleet uses a single instance type to launch all Spot Instances in the fleet.

Supported only for fleets of type `instant`.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotPlacement

Describes Spot Instance placement.

## Contents

**AvailabilityZone** (request), **availabilityZone** (response)

The Availability Zone. For example, `us-east-2a`.

[Spot Fleet only] To specify multiple Availability Zones, separate them using commas; for example, "`us-east-2a`, `us-east-2b`".

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: String

Required: No

**AvailabilityZoneId** (request), **availabilityZoneId** (response)

The ID of the Availability Zone. For example, `use2-az1`.

[Spot Fleet only] To specify multiple Availability Zones, separate them using commas; for example, "`use2-az1`, `use2-bz1`".

Either `AvailabilityZone` or `AvailabilityZoneId` must be specified in the request, but not both.

Type: String

Required: No

**GroupName** (request), **groupName** (response)

The name of the placement group.

Type: String

Required: No

**Tenancy** (request), **tenancy** (response)

The tenancy of the instance (if the instance is running in a VPC). An instance with a tenancy of `dedicated` runs on single-tenant hardware. The `host` tenancy is not supported for Spot Instances.

Type: String

Valid Values: `default | dedicated | host`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SpotPlacementScore

The Spot placement score for this Region or Availability Zone. The score is calculated based on the assumption that the `capacity-optimized` allocation strategy is used and that all of the Availability Zones in the Region can be used.

## Contents

**availabilityZoneId**

The Availability Zone.

Type: String

Required: No

**region**

The Region.

Type: String

Required: No

**score**

The placement score, on a scale from `1` to `10`. A score of `10` indicates that your Spot request is highly likely to succeed in this Region or Availability Zone. A score of `1` indicates that your Spot request is not likely to succeed.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# SpotPrice

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.

## Contents

**availabilityZone**

The Availability Zone.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**instanceType**

The instance type.

Type: String

Valid Values: `a1.medium | a1.large | a1.xlarge | a1.2xlarge | a1.4xlarge | a1.metal | c1.medium | c1.xlarge | c3.large | c3.xlarge | c3.2xlarge | c3.4xlarge | c3.8xlarge | c4.large | c4.xlarge | c4.2xlarge | c4.4xlarge | c4.8xlarge | c5.large | c5.xlarge | c5.2xlarge | c5.4xlarge | c5.9xlarge | c5.12xlarge | c5.18xlarge | c5.24xlarge | c5.metal | c5a.large | c5a.xlarge | c5a.2xlarge | c5a.4xlarge | c5a.8xlarge | c5a.12xlarge | c5a.16xlarge | c5a.24xlarge | c5ad.large | c5ad.xlarge`

Required: No

**productDescription**

A general description of the AMI.

Type: String

Valid Values: Linux/UNIX | Linux/UNIX (Amazon VPC) | Windows | Windows (Amazon VPC)

Required: No

**spotPrice**

The maximum price per unit hour that you are willing to pay for a Spot Instance. We do not recommend using this parameter because it can lead to increased interruptions. If you do not specify this parameter, you will pay the current Spot price.

> **Important**
>
> If you specify a maximum price, your instances will be interrupted more frequently than if you do not specify this parameter.

Type: String

Required: No

**timestamp**

The date and time the request was created, in UTC format (for example, *YYYY-MM-DD*T*HH*:*MM*:*SS*Z).

Type: Timestamp

Required: No

# StaleIpPermission

Describes a stale rule in a security group.

## Contents

**fromPort**

If the protocol is TCP or UDP, this is the start of the port range. If the protocol is ICMP or ICMPv6, this is the ICMP type or -1 (all ICMP types).

Type: Integer

Required: No

**Groups.N**

The security group pairs. Returns the ID of the referenced security group and VPC, and the ID and status of the VPC peering connection.

Type: Array of UserIdGroupPair objects

Required: No

**ipProtocol**

The IP protocol name (`tcp`, `udp`, `icmp`, `icmpv6`) or number (see Protocol Numbers).

Type: String

Required: No

**IpRanges.N**

The IP ranges. Not applicable for stale security group rules.

Type: Array of strings

Required: No

**PrefixListIds.N**

The prefix list IDs. Not applicable for stale security group rules.

Type: Array of strings

Required: No

**toPort**

If the protocol is TCP or UDP, this is the end of the port range. If the protocol is ICMP or ICMPv6, this is the ICMP code or -1 (all ICMP codes).

Type: Integer

Required: No

## See Also

# StaleSecurityGroup

Describes a stale security group (a security group that contains stale rules).

## Contents

**description**

The description of the security group.

Type: String

Required: No

**groupId**

The ID of the security group.

Type: String

Required: No

**groupName**

The name of the security group.

Type: String

Required: No

**StaleIpPermissions.N**

Information about the stale inbound rules in the security group.

Type: Array of StaleIpPermission objects

Required: No

**StaleIpPermissionsEgress.N**

Information about the stale outbound rules in the security group.

Type: Array of StaleIpPermission objects

Required: No

**vpcId**

The ID of the VPC for the security group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# StateReason

Describes a state change.

## Contents

**code**

The reason code for the state change.

Type: String

Required: No

**message**

The message for the state change.

- `Server.InsufficientInstanceCapacity`: There was insufficient capacity available to satisfy the launch request.
- `Server.InternalError`: An internal error caused the instance to terminate during launch.
- `Server.ScheduledStop`: The instance was stopped due to a scheduled retirement.
- `Server.SpotInstanceShutdown`: The instance was stopped because the number of Spot requests with a maximum price equal to or higher than the Spot price exceeded available capacity or because of an increase in the Spot price.
- `Server.SpotInstanceTermination`: The instance was terminated because the number of Spot requests with a maximum price equal to or higher than the Spot price exceeded available capacity or because of an increase in the Spot price.
- `Client.InstanceInitiatedShutdown`: The instance was shut down from the operating system of the instance.
- `Client.InstanceTerminated`: The instance was terminated or rebooted during AMI creation.
- `Client.InternalError`: A client error caused the instance to terminate during launch.
- `Client.InvalidSnapshot.NotFound`: The specified snapshot was not found.
- `Client.UserInitiatedHibernate`: Hibernation was initiated on the instance.
- `Client.UserInitiatedShutdown`: The instance was shut down using the Amazon EC2 API.
- `Client.VolumeLimitExceeded`: The limit on the number of EBS volumes or total storage was exceeded. Decrease usage or request an increase in your account limits.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Storage

Describes the storage location for an instance store-backed AMI.

## Contents

**S3** (request), **S3** (response)

An Amazon S3 storage location.

Type: S3Storage object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# StorageLocation

Describes a storage location in Amazon S3.

## Contents

**Bucket**

The name of the S3 bucket.

Type: String

Required: No

**Key**

The key.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# StoreImageTaskResult

The information about the AMI store task, including the progress of the task.

## Contents

**amiId**

The ID of the AMI that is being stored.

Type: String

Required: No

**bucket**

The name of the Amazon S3 bucket that contains the stored AMI object.

Type: String

Required: No

**progressPercentage**

The progress of the task as a percentage.

Type: Integer

Required: No

**s3objectKey**

The name of the stored AMI object in the bucket.

Type: String

Required: No

**storeTaskFailureReason**

If the tasks fails, the reason for the failure is returned. If the task succeeds, `null` is returned.

Type: String

Required: No

**storeTaskState**

The state of the store task (`InProgress`, `Completed`, or `Failed`).

Type: String

Required: No

**taskStartTime**

The time the task started.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Subnet

Describes a subnet.

## Contents

**assignIpv6AddressOnCreation**

Indicates whether a network interface created in this subnet (including a network interface created by RunInstances) receives an IPv6 address.

Type: Boolean

Required: No

**availabilityZone**

The Availability Zone of the subnet.

Type: String

Required: No

**availabilityZoneId**

The AZ ID of the subnet.

Type: String

Required: No

**availableIpAddressCount**

The number of unused private IPv4 addresses in the subnet. The IPv4 addresses for any stopped instances are considered unavailable.

Type: Integer

Required: No

**blockPublicAccessStates**

The state of VPC Block Public Access (BPA).

Type: BlockPublicAccessStates object

Required: No

**cidrBlock**

The IPv4 CIDR block assigned to the subnet.

Type: String

Required: No

**customerOwnedIpv4Pool**

The customer-owned IPv4 address pool associated with the subnet.

Type: String

Required: No

**defaultForAz**

Indicates whether this is the default subnet for the Availability Zone.

Type: Boolean

Required: No

**enableDns64**

Indicates whether DNS queries made to the Amazon-provided DNS Resolver in this subnet should return synthetic IPv6 addresses for IPv4-only destinations.

Type: Boolean

Required: No

**enableLniAtDeviceIndex**

Indicates the device position for local network interfaces in this subnet. For example, 1 indicates local network interfaces in this subnet are the secondary network interface (eth1).

Type: Integer

Required: No

**Ipv6CidrBlockAssociationSet.N**

Information about the IPv6 CIDR blocks associated with the subnet.

Type: Array of SubnetIpv6CidrBlockAssociation objects

Required: No

**ipv6Native**

Indicates whether this is an IPv6 only subnet.

Type: Boolean

Required: No

**mapCustomerOwnedIpOnLaunch**

Indicates whether a network interface created in this subnet (including a network interface created by RunInstances) receives a customer-owned IPv4 address.

Type: Boolean

Required: No

**mapPublicIpOnLaunch**

Indicates whether instances launched in this subnet receive a public IPv4 address.

AWS charges for all public IPv4 addresses, including public IPv4 addresses associated with running instances and Elastic IP addresses. For more information, see the *Public IPv4 Address* tab on the Amazon VPC pricing page.

Type: Boolean

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost.

Type: String

Required: No

**ownerId**

The ID of the AWS account that owns the subnet.

Type: String

Required: No

**privateDnsNameOptionsOnLaunch**

The type of hostnames to assign to instances in the subnet at launch. An instance hostname is based on the IPv4 address or ID of the instance.

Type: PrivateDnsNameOptionsOnLaunch object

Required: No

**state**

The current state of the subnet.

- `failed`: The underlying infrastructure to support the subnet failed to provision as expected.
- `failed-insufficient-capacity`: The underlying infrastructure to support the subnet failed to provision due to a shortage of EC2 instance capacity.

Type: String

Valid Values: `pending | available | unavailable | failed | failed-insufficient-capacity`

Required: No

**subnetArn**

The Amazon Resource Name (ARN) of the subnet.

Type: String

Required: No

**subnetId**

The ID of the subnet.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the subnet.

Type: Array of Tag objects

Required: No

**type**

Indicates if this is a subnet used with Amazon Elastic VMware Service (EVS). Possible values are `Elastic VMware Service` or no value. For more information about Amazon EVS, see *Amazon Elastic VMware Service API Reference*.

Type: String

Required: No

**vpcId**

The ID of the VPC the subnet is in.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SubnetAssociation

Describes the subnet association with the transit gateway multicast domain.

## Contents

**state**

The state of the subnet association.

Type: String

Valid Values: `pendingAcceptance | associating | associated | disassociating | disassociated | rejected | failed`

Required: No

**subnetId**

The ID of the subnet.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SubnetCidrBlockState

Describes the state of a CIDR block.

## Contents

**state**

The state of a CIDR block.

Type: String

Valid Values: `associating | associated | disassociating | disassociated | failing | failed`

Required: No

**statusMessage**

A message about the status of the CIDR block, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SubnetCidrReservation

Describes a subnet CIDR reservation.

## Contents

**cidr**

The CIDR that has been reserved.

Type: String

Required: No

**description**

The description assigned to the subnet CIDR reservation.

Type: String

Required: No

**ownerId**

The ID of the account that owns the subnet CIDR reservation.

Type: String

Required: No

**reservationType**

The type of reservation.

Type: String

Valid Values: `prefix | explicit`

Required: No

**subnetCidrReservationId**

The ID of the subnet CIDR reservation.

Type: String

Required: No

**subnetId**

The ID of the subnet.

Type: String

Required: No

**TagSet.N**

The tags assigned to the subnet CIDR reservation.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SubnetConfiguration

Describes the configuration of a subnet for a VPC endpoint.

## Contents

**Ipv4**

The IPv4 address to assign to the endpoint network interface in the subnet. You must provide an IPv4 address if the VPC endpoint supports IPv4.

If you specify an IPv4 address when modifying a VPC endpoint, we replace the existing endpoint network interface with a new endpoint network interface with this IP address. This process temporarily disconnects the subnet and the VPC endpoint.

Type: String

Required: No

**Ipv6**

The IPv6 address to assign to the endpoint network interface in the subnet. You must provide an IPv6 address if the VPC endpoint supports IPv6.

If you specify an IPv6 address when modifying a VPC endpoint, we replace the existing endpoint network interface with a new endpoint network interface with this IP address. This process temporarily disconnects the subnet and the VPC endpoint.

Type: String

Required: No

**SubnetId**

The ID of the subnet.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SubnetIpPrefixes

Prefixes of the subnet IP.

## Contents

**IpPrefixSet.N**

Array of SubnetIpPrefixes objects.

Type: Array of strings

Required: No

**subnetId**

ID of the subnet.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SubnetIpv6CidrBlockAssociation

Describes an association between a subnet and an IPv6 CIDR block.

## Contents

**associationId**

The ID of the association.

Type: String

Required: No

**ipSource**

The source that allocated the IP address space. `byoip` or `amazon` indicates public IP address space allocated by Amazon or space that you have allocated with Bring your own IP (BYOIP). `none` indicates private space.

Type: String

Valid Values: `amazon | byoip | none`

Required: No

**ipv6AddressAttribute**

Public IPv6 addresses are those advertised on the internet from AWS. Private IP addresses are not and cannot be advertised on the internet from AWS.

Type: String

Valid Values: `public | private`

Required: No

**ipv6CidrBlock**

The IPv6 CIDR block.

Type: String

Required: No

**ipv6CidrBlockState**

The state of the CIDR block.

Type: SubnetCidrBlockState object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Subscription

Describes an Infrastructure Performance subscription.

## Contents

**destination**

The Region or Availability Zone that's the target for the subscription. For example, `eu-west-1`.

Type: String

Required: No

**metric**

The metric used for the subscription.

Type: String

Valid Values: `aggregate-latency`

Required: No

**period**

The data aggregation time for the subscription.

Type: String

Valid Values: `five-minutes | fifteen-minutes | one-hour | three-hours | one-day | one-week`

Required: No

**source**

The Region or Availability Zone that's the source for the subscription. For example, `us-east-1`.

Type: String

Required: No

**statistic**

The statistic used for the subscription.

Type: String

Valid Values: `p50`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SuccessfulInstanceCreditSpecificationItem

Describes the burstable performance instance whose credit option for CPU usage was successfully modified.

## Contents

**instanceId**

The ID of the instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SuccessfulQueuedPurchaseDeletion

Describes a Reserved Instance whose queued purchase was successfully deleted.

## Contents

**reservedInstancesId**

The ID of the Reserved Instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# SupportedRegionDetail

Describes a supported Region.

## Contents

**region**

The Region code.

Type: String

Required: No

**serviceState**

The service state. The possible values are `Pending`, `Available`, `Deleting`, `Deleted`, `Failed`, and `Closed`.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Tag

Describes a tag.

## Contents

**Key** (request), **key** (response)

The key of the tag.

Constraints: Tag keys are case-sensitive and accept a maximum of 127 Unicode characters. May not begin with `aws:`.

Type: String

Required: No

**Value** (request), **value** (response)

The value of the tag.

Constraints: Tag values are case-sensitive and accept a maximum of 256 Unicode characters.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TagDescription

Describes a tag.

## Contents

**key**

The tag key.

Type: String

Required: No

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceType**

The resource type.

Type: String

Valid Values: `capacity-reservation | client-vpn-endpoint | customer-gateway | carrier-gateway | coip-pool | declarative-policies-report | dedicated-host | dhcp-options | egress-only-internet-gateway | elastic-ip | elastic-gpu | export-image-task | export-instance-task | fleet | fpga-image | host-reservation | image | image-usage-report | import-image-task | import-snapshot-task | instance | instance-event-window | internet-gateway | ipam | ipam-pool | ipam-scope | ipv4pool-ec2 | ipv6pool-ec2 | key-pair | launch-template | local-gateway | local-gateway-route-table | local-gateway-virtual-interface | local-gateway-virtual-interface-group | local-gateway-route-table-vpc-association | local-gateway-route-table-virtual-interface-group-association | natgateway | network-acl | network-interface | network-insights-analysis | network-insights-path | network-insights-access-scope | network-insights-access-scope-analysis | outpost-lag | placement-group | prefix-`

list | replace-root-volume-task | reserved-instances | route-table | security-group | security-group-rule | service-link-virtual-interface | snapshot | spot-fleet-request | spot-instances-request | subnet | subnet-cidr-reservation | traffic-mirror-filter | traffic-mirror-session | traffic-mirror-target | transit-gateway | transit-gateway-attachment | transit-gateway-connect-peer | transit-gateway-multicast-domain | transit-gateway-policy-table | transit-gateway-metering-policy | transit-gateway-route-table | transit-gateway-route-table-announcement | volume | vpc | vpc-endpoint | vpc-endpoint-connection | vpc-endpoint-service | vpc-endpoint-service-permission | vpc-peering-connection | vpn-connection | vpn-gateway | vpc-flow-log | capacity-reservation-fleet | traffic-mirror-filter-rule | vpc-endpoint-connection-device-type | verified-access-instance | verified-access-group | verified-access-endpoint | verified-access-policy | verified-access-trust-provider | vpn-connection-device-type | vpc-block-public-access-exclusion | vpc-encryption-control | route-server | route-server-endpoint | route-server-peer | ipam-resource-discovery | ipam-resource-discovery-association | instance-connect-endpoint | verified-access-endpoint-target | ipam-external-resource-verification-token | capacity-block | mac-modification-task | ipam-prefix-list-resolver | ipam-policy | ipam-prefix-list-resolver-target | secondary-interface | secondary-network | secondary-subnet | capacity-manager-data-export | vpn-concentrator | ipam-pool-allocation | capacity-reservation-cancellation-quote

Required: No

**value**

The tag value.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

# TagFieldSpecificationRequest

A single resource's tag configuration associated with the Flow Logs Amazon EC2 Tags feature fields in your custom log format.

## Contents

**ResourceType**

The resource type for the tag keys associated with the Flow Logs Amazon EC2 Tags feature fields in your custom log format.

Type: String

Valid Values: `network-interface | instance | auto-scaling-group`

Required: No

**TagKey.N**

The tag keys on your tagged resources to be displayed by the Flow Logs Amazon EC2 Tags feature fields in your custom log format.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TagFieldSpecificationResponse

A single resource's tag configuration associated with the Flow Logs Amazon EC2 Tags feature fields in your custom log format.

## Contents

**resourceType**

The resource type for the tag keys associated with the Flow Logs Amazon EC2 Tags feature fields in your custom log format.

Type: String

Valid Values: `network-interface | instance | auto-scaling-group`

Required: No

**TagKeySet.N**

The tag keys on your tagged resources to be displayed by the Flow Logs Amazon EC2 Tags feature fields in your custom log format.

Type: Array of strings

Array Members: Minimum number of 1 item. Maximum number of 2 items.

Length Constraints: Minimum length of 1. Maximum length of 128.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TagSpecification

The tags to apply to a resource when the resource is being created. When you specify a tag, you must specify the resource type to tag, otherwise the request will fail.

> **Note**
>
> The `Valid Values` lists all the resource types that can be tagged. However, the action you're using might not support tagging all of these resource types. If you try to tag a resource type that is unsupported for the action you're using, you'll get an error.

## Contents

**ResourceType** (request), **resourceType** (response)

The type of resource to tag on creation.

Type: String

Valid Values: `capacity-reservation | client-vpn-endpoint | customer-gateway | carrier-gateway | coip-pool | declarative-policies-report | dedicated-host | dhcp-options | egress-only-internet-gateway | elastic-ip | elastic-gpu | export-image-task | export-instance-task | fleet | fpga-image | host-reservation | image | image-usage-report | import-image-task | import-snapshot-task | instance | instance-event-window | internet-gateway | ipam | ipam-pool | ipam-scope | ipv4pool-ec2 | ipv6pool-ec2 | key-pair | launch-template | local-gateway | local-gateway-route-table | local-gateway-virtual-interface | local-gateway-virtual-interface-group | local-gateway-route-table-vpc-association | local-gateway-route-table-virtual-interface-group-association | natgateway | network-acl | network-interface | network-insights-analysis | network-insights-path | network-insights-access-scope | network-insights-access-scope-analysis | outpost-lag | placement-group | prefix-list | replace-root-volume-task | reserved-instances | route-table | security-group | security-group-rule | service-link-virtual-interface | snapshot | spot-fleet-request | spot-instances-request | subnet | subnet-cidr-reservation | traffic-mirror-filter | traffic-mirror-`

```
session | traffic-mirror-target | transit-gateway | transit-gateway-
attachment | transit-gateway-connect-peer | transit-gateway-multicast-
domain | transit-gateway-policy-table | transit-gateway-metering-policy

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TargetCapacitySpecification

The number of units to request. You can choose to set the target capacity in terms of instances or a performance characteristic that is important to your application workload, such as vCPUs, memory, or I/O. If the request type is `maintain`, you can specify a target capacity of 0 and add capacity later.

You can use the On-Demand Instance `MaxTotalPrice` parameter, the Spot Instance `MaxTotalPrice`, or both to ensure that your fleet cost does not exceed your budget. If you set a maximum price per hour for the On-Demand Instances and Spot Instances in your request, EC2 Fleet will launch instances until it reaches the maximum amount that you're willing to pay. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity. The `MaxTotalPrice` parameters are located in OnDemandOptions and SpotOptions.

## Contents

**defaultTargetCapacityType**

The default target capacity type.

Type: String

Valid Values: `spot | on-demand | capacity-block | reserved-capacity`

Required: No

**onDemandTargetCapacity**

The number of On-Demand units to request. If you specify a target capacity for Spot units, you cannot specify a target capacity for On-Demand units.

Type: Integer

Required: No

**spotTargetCapacity**

The maximum number of Spot units to launch. If you specify a target capacity for On-Demand units, you cannot specify a target capacity for Spot units.

Type: Integer

Required: No

**targetCapacityUnitType**

The unit for the target capacity.

Type: String

Valid Values: `vcpu | memory-mib | units`

Required: No

**totalTargetCapacity**

The number of units to request, filled the default target capacity type.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TargetCapacitySpecificationRequest

The number of units to request. You can choose to set the target capacity as the number of instances. Or you can set the target capacity to a performance characteristic that is important to your application workload, such as vCPUs, memory, or I/O. If the request type is `maintain`, you can specify a target capacity of 0 and add capacity later.

You can use the On-Demand Instance `MaxTotalPrice` parameter, the Spot Instance `MaxTotalPrice` parameter, or both parameters to ensure that your fleet cost does not exceed your budget. If you set a maximum price per hour for the On-Demand Instances and Spot Instances in your request, EC2 Fleet will launch instances until it reaches the maximum amount that you're willing to pay. When the maximum amount you're willing to pay is reached, the fleet stops launching instances even if it hasn't met the target capacity. The `MaxTotalPrice` parameters are located in OnDemandOptionsRequest and SpotOptionsRequest.

## Contents

**TotalTargetCapacity**

The number of units to request, filled using the default target capacity type.

Type: Integer

Required: Yes

**DefaultTargetCapacityType**

The default target capacity type.

Type: String

Valid Values: `spot | on-demand | capacity-block | reserved-capacity`

Required: No

**OnDemandTargetCapacity**

The number of On-Demand units to request.

Type: Integer

Required: No

**SpotTargetCapacity**

The number of Spot units to request.

Type: Integer

Required: No

**TargetCapacityUnitType**

The unit for the target capacity. You can specify this parameter only when using attributed-based instance type selection.

Default: `units` (the number of instances)

Type: String

Valid Values: `vcpu | memory-mib | units`

Required: No

## See Also

# TargetConfiguration

Information about the Convertible Reserved Instance offering.

## Contents

**instanceCount**

The number of instances the Convertible Reserved Instance offering can be applied to. This parameter is reserved and cannot be specified in a request

Type: Integer

Required: No

**offeringId**

The ID of the Convertible Reserved Instance offering.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TargetConfigurationRequest

Details about the target configuration.

## Contents

**OfferingId**

The Convertible Reserved Instance offering ID.

Type: String

Required: Yes

**InstanceCount**

The number of instances the Convertible Reserved Instance offering can be applied to. This parameter is reserved and cannot be specified in a request

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TargetGroup

Describes a load balancer target group.

## Contents

**Arn** (request), **arn** (response)

The Amazon Resource Name (ARN) of the target group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TargetGroupsConfig

Describes the target groups to attach to a Spot Fleet. Spot Fleet registers the running Spot Instances with these target groups.

## Contents

**TargetGroups.N**

One or more target groups.

Type: Array of TargetGroup objects

Array Members: Minimum number of 1 item. Maximum number of 5 items.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TargetNetwork

Describes a target network associated with a Client VPN endpoint.

## Contents

**associationId**

The ID of the association.

Type: String

Required: No

**AvailabilityZoneIdSet.N**

The Availability Zone IDs for the target network association, if the Client VPN endpoint uses a Transit Gateway.

Type: Array of strings

Required: No

**AvailabilityZoneSet.N**

The Availability Zone names for the target network association, if the Client VPN endpoint uses a Transit Gateway.

Type: Array of strings

Required: No

**clientVpnEndpointId**

The ID of the Client VPN endpoint with which the target network is associated.

Type: String

Required: No

**SecurityGroups.N**

The IDs of the security groups applied to the target network association.

Type: Array of strings

Required: No

**status**

The current state of the target network association.

Type: AssociationStatus object

Required: No

**targetNetworkId**

The ID of the subnet specified as the target network.

Type: String

Required: No

**vpcId**

The ID of the VPC in which the target network (subnet) is located.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TargetReservationValue

The total value of the new Convertible Reserved Instances.

## Contents

**reservationValue**

The total value of the Convertible Reserved Instances that make up the exchange. This is the sum of the list value, remaining upfront price, and additional upfront cost of the exchange.

Type: ReservationValue object

Required: No

**targetConfiguration**

The configuration of the Convertible Reserved Instances that make up the exchange.

Type: TargetConfiguration object

Required: No

## See Also

- AWS SDK for Ruby V3

# TerminateConnectionStatus

Information about a terminated Client VPN endpoint client connection.

## Contents

**connectionId**

The ID of the client connection.

Type: String

Required: No

**currentStatus**

A message about the status of the client connection, if applicable.

Type: ClientVpnConnectionStatus object

Required: No

**previousStatus**

The state of the client connection.

Type: ClientVpnConnectionStatus object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ThroughResourcesStatement

Describes a through resource statement.

## Contents

**resourceStatement**

The resource statement.

Type: ResourceStatement object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ThroughResourcesStatementRequest

Describes a through resource statement.

## Contents

**ResourceStatement**

The resource statement.

Type: ResourceStatementRequest object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TotalLocalStorageGB

The minimum and maximum amount of total local storage, in GB.

## Contents

**Max** (request), **max** (response)

The maximum amount of total local storage, in GB. If this parameter is not specified, there is no maximum limit.

Type: Double

Required: No

**Min** (request), **min** (response)

The minimum amount of total local storage, in GB. If this parameter is not specified, there is no minimum limit.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TotalLocalStorageGBRequest

The minimum and maximum amount of total local storage, in GB.

## Contents

**Max**

The maximum amount of total local storage, in GB. To specify no maximum limit, omit this parameter.

Type: Double

Required: No

**Min**

The minimum amount of total local storage, in GB. To specify no minimum limit, omit this parameter.

Type: Double

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TrafficMirrorFilter

Describes the Traffic Mirror filter.

## Contents

**description**

The description of the Traffic Mirror filter.

Type: String

Required: No

**EgressFilterRuleSet.N**

Information about the egress rules that are associated with the Traffic Mirror filter.

Type: Array of TrafficMirrorFilterRule objects

Required: No

**IngressFilterRuleSet.N**

Information about the ingress rules that are associated with the Traffic Mirror filter.

Type: Array of TrafficMirrorFilterRule objects

Required: No

**NetworkServiceSet.N**

The network service traffic that is associated with the Traffic Mirror filter.

Type: Array of strings

Valid Values: `amazon-dns`

Required: No

**TagSet.N**

The tags assigned to the Traffic Mirror filter.

Type: Array of Tag objects

Required: No

**trafficMirrorFilterId**

The ID of the Traffic Mirror filter.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TrafficMirrorFilterRule

Describes the Traffic Mirror rule.

## Contents

**description**

The description of the Traffic Mirror rule.

Type: String

Required: No

**destinationCidrBlock**

The destination CIDR block assigned to the Traffic Mirror rule.

Type: String

Required: No

**destinationPortRange**

The destination port range assigned to the Traffic Mirror rule.

Type: TrafficMirrorPortRange object

Required: No

**protocol**

The protocol assigned to the Traffic Mirror rule.

Type: Integer

Required: No

**ruleAction**

The action assigned to the Traffic Mirror rule.

Type: String

Valid Values: `accept | reject`

Required: No

**ruleNumber**

The rule number of the Traffic Mirror rule.

Type: Integer

Required: No

**sourceCidrBlock**

The source CIDR block assigned to the Traffic Mirror rule.

Type: String

Required: No

**sourcePortRange**

The source port range assigned to the Traffic Mirror rule.

Type: TrafficMirrorPortRange object

Required: No

**TagSet.N**

Tags on Traffic Mirroring filter rules.

Type: Array of Tag objects

Required: No

**trafficDirection**

The traffic direction assigned to the Traffic Mirror rule.

Type: String

Valid Values: `ingress | egress`

Required: No

**trafficMirrorFilterId**

The ID of the Traffic Mirror filter that the rule is associated with.

Type: String

Required: No

**trafficMirrorFilterRuleId**

The ID of the Traffic Mirror rule.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TrafficMirrorPortRange

Describes the Traffic Mirror port range.

## Contents

**fromPort**

The start of the Traffic Mirror port range. This applies to the TCP and UDP protocols.

Type: Integer

Required: No

**toPort**

The end of the Traffic Mirror port range. This applies to the TCP and UDP protocols.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TrafficMirrorPortRangeRequest

Information about the Traffic Mirror filter rule port range.

## Contents

**FromPort**

The first port in the Traffic Mirror port range. This applies to the TCP and UDP protocols.

Type: Integer

Required: No

**ToPort**

The last port in the Traffic Mirror port range. This applies to the TCP and UDP protocols.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TrafficMirrorSession

Describes a Traffic Mirror session.

## Contents

**description**

The description of the Traffic Mirror session.

Type: String

Required: No

**networkInterfaceId**

The ID of the Traffic Mirror session's network interface.

Type: String

Required: No

**ownerId**

The ID of the account that owns the Traffic Mirror session.

Type: String

Required: No

**packetLength**

The number of bytes in each packet to mirror. These are the bytes after the VXLAN header. To mirror a subset, set this to the length (in bytes) to mirror. For example, if you set this value to 100, then the first 100 bytes that meet the filter criteria are copied to the target. Do not specify this parameter when you want to mirror the entire packet

Type: Integer

Required: No

**sessionNumber**

The session number determines the order in which sessions are evaluated when an interface is used by multiple sessions. The first session with a matching filter is the one that mirrors the packets.

Valid values are 1-32766.

Type: Integer

Required: No

**TagSet.N**

The tags assigned to the Traffic Mirror session.

Type: Array of Tag objects

Required: No

**trafficMirrorFilterId**

The ID of the Traffic Mirror filter.

Type: String

Required: No

**trafficMirrorSessionId**

The ID for the Traffic Mirror session.

Type: String

Required: No

**trafficMirrorTargetId**

The ID of the Traffic Mirror target.

Type: String

Required: No

**virtualNetworkId**

The virtual network ID associated with the Traffic Mirror session.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TrafficMirrorTarget

Describes a Traffic Mirror target.

## Contents

**description**

Information about the Traffic Mirror target.

Type: String

Required: No

**gatewayLoadBalancerEndpointId**

The ID of the Gateway Load Balancer endpoint.

Type: String

Required: No

**networkInterfaceId**

The network interface ID that is attached to the target.

Type: String

Required: No

**networkLoadBalancerArn**

The Amazon Resource Name (ARN) of the Network Load Balancer.

Type: String

Required: No

**ownerId**

The ID of the account that owns the Traffic Mirror target.

Type: String

Required: No

**TagSet.N**

The tags assigned to the Traffic Mirror target.

Type: Array of Tag objects

Required: No

**trafficMirrorTargetId**

The ID of the Traffic Mirror target.

Type: String

Required: No

**type**

The type of Traffic Mirror target.

Type: String

Valid Values: `network-interface | network-load-balancer | gateway-load-balancer-endpoint`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGateway

Describes a transit gateway.

## Contents

**creationTime**

The creation time.

Type: Timestamp

Required: No

**description**

The description of the transit gateway.

Type: String

Required: No

**options**

The transit gateway options.

Type: TransitGatewayOptions object

Required: No

**ownerId**

The ID of the AWS account that owns the transit gateway.

Type: String

Required: No

**state**

The state of the transit gateway.

Type: String

Valid Values: `pending | available | modifying | deleting | deleted`

Required: No

**TagSet.N**

The tags for the transit gateway.

Type: Array of Tag objects

Required: No

**transitGatewayArn**

The Amazon Resource Name (ARN) of the transit gateway.

Type: String

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayAssociation

Describes an association between a resource attachment and a transit gateway route table.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceType**

The resource type. Note that the `tgw-peering` resource type has been deprecated.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**state**

The state of the association.

Type: String

Valid Values: `associating | associated | disassociating | disassociated`

Required: No

**transitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

**transitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayAttachment

Describes an attachment between a resource and a transit gateway.

## Contents

**association**

The association.

Type: TransitGatewayAttachmentAssociation object

Required: No

**creationTime**

The creation time.

Type: Timestamp

Required: No

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceOwnerId**

The ID of the AWS account that owns the resource.

Type: String

Required: No

**resourceType**

The resource type. Note that the `tgw-peering` resource type has been deprecated.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**state**

The attachment state. Note that the `initiating` state has been deprecated.

Type: String

Valid Values: `initiating | initiatingRequest | pendingAcceptance | rollingBack | pending | available | modifying | deleting | deleted | failed | rejected | rejecting | failing`

Required: No

**TagSet.N**

The tags for the attachment.

Type: Array of Tag objects

Required: No

**transitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

**transitGatewayOwnerId**

The ID of the AWS account that owns the transit gateway.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayAttachmentAssociation

Describes an association.

## Contents

**state**

The state of the association.

Type: String

Valid Values: `associating | associated | disassociating | disassociated`

Required: No

**transitGatewayRouteTableId**

The ID of the route table for the transit gateway.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayAttachmentBgpConfiguration

The BGP configuration information.

## Contents

**bgpStatus**

The BGP status.

Type: String

Valid Values: `up` | `down`

Required: No

**peerAddress**

The interior BGP peer IP address for the appliance.

Type: String

Required: No

**peerAsn**

The peer Autonomous System Number (ASN).

Type: Long

Required: No

**transitGatewayAddress**

The interior BGP peer IP address for the transit gateway.

Type: String

Required: No

**transitGatewayAsn**

The transit gateway Autonomous System Number (ASN).

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayAttachmentPropagation

Describes a propagation route table.

## Contents

**state**

The state of the propagation route table.

Type: String

Valid Values: `enabling | enabled | disabling | disabled`

Required: No

**transitGatewayRouteTableId**

The ID of the propagation route table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayClientVpnAttachment

Describes a Transit Gateway attachment for a Client VPN endpoint.

## Contents

**clientVpnEndpointId**

The ID of the Client VPN endpoint.

Type: String

Required: No

**clientVpnOwnerId**

The ID of the Amazon Web Services account that owns the Client VPN endpoint.

Type: String

Required: No

**creationTime**

The date and time the Transit Gateway attachment was created.

Type: String

Required: No

**state**

The state of the Transit Gateway attachment.

Type: String

Valid Values: `pending-acceptance | pending | rejected | available | deleting | deleted`

Required: No

**transitGatewayAttachmentId**

The ID of the Transit Gateway attachment.

Type: String

Required: No

**transitGatewayId**

The ID of the Transit Gateway.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayConfigurationDescribeEndpointStructure

Describes the Transit Gateway configuration for a Client VPN endpoint.

## Contents

**AvailabilityZoneIdSet.N**

The Availability Zone IDs for the Transit Gateway association.

Type: Array of strings

Required: No

**AvailabilityZoneSet.N**

The Availability Zone names for the Transit Gateway association.

Type: Array of strings

Required: No

**transitGatewayAttachmentId**

The ID of the Transit Gateway attachment.

Type: String

Required: No

**transitGatewayId**

The ID of the Transit Gateway.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayConfigurationInputStructure

The Transit Gateway configuration for a Client VPN endpoint.

## Contents

**AvailabilityZone.N**

The Availability Zone names for the Transit Gateway association. You can specify up to the maximum number of Availability Zones supported by the Transit Gateway. You cannot specify both `AvailabilityZones` and `AvailabilityZoneIds`.

Type: Array of strings

Required: No

**AvailabilityZoneId.N**

The Availability Zone IDs for the Transit Gateway association. You can specify up to the maximum number of Availability Zones supported by the Transit Gateway. You cannot specify both `AvailabilityZones` and `AvailabilityZoneIds`.

Type: Array of strings

Required: No

**TransitGatewayId**

The ID of the Transit Gateway to associate with the Client VPN endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# TransitGatewayConnect

Describes a transit gateway Connect attachment.

## Contents

**creationTime**

The creation time.

Type: Timestamp

Required: No

**options**

The Connect attachment options.

Type: TransitGatewayConnectOptions object

Required: No

**state**

The state of the attachment.

Type: String

Valid Values: `initiating | initiatingRequest | pendingAcceptance | rollingBack | pending | available | modifying | deleting | deleted | failed | rejected | rejecting | failing`

Required: No

**TagSet.N**

The tags for the attachment.

Type: Array of Tag objects

Required: No

**transitGatewayAttachmentId**

The ID of the Connect attachment.

Type: String

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

**transportTransitGatewayAttachmentId**

The ID of the attachment from which the Connect attachment was created.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayConnectOptions

Describes the Connect attachment options.

## Contents

**protocol**

The tunnel protocol.

Type: String

Valid Values: `gre`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayConnectPeer

Describes a transit gateway Connect peer.

## Contents

**connectPeerConfiguration**

The Connect peer details.

Type: TransitGatewayConnectPeerConfiguration object

Required: No

**creationTime**

The creation time.

Type: Timestamp

Required: No

**state**

The state of the Connect peer.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**TagSet.N**

The tags for the Connect peer.

Type: Array of Tag objects

Required: No

**transitGatewayAttachmentId**

The ID of the Connect attachment.

Type: String

Required: No

**transitGatewayConnectPeerId**

The ID of the Connect peer.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayConnectPeerConfiguration

Describes the Connect peer details.

## Contents

**BgpConfigurations.N**

The BGP configuration details.

Type: Array of TransitGatewayAttachmentBgpConfiguration objects

Required: No

**InsideCidrBlocks.N**

The range of interior BGP peer IP addresses.

Type: Array of strings

Required: No

**peerAddress**

The Connect peer IP address on the appliance side of the tunnel.

Type: String

Required: No

**protocol**

The tunnel protocol.

Type: String

Valid Values: `gre`

Required: No

**transitGatewayAddress**

The Connect peer IP address on the transit gateway side of the tunnel.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayConnectRequestBgpOptions

The BGP options for the Connect attachment.

## Contents

**PeerAsn**

The peer Autonomous System Number (ASN).

Type: Long

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMeteringPolicy

Describes a transit gateway metering policy.

## Contents

**MiddleboxAttachmentIdSet.N**

The IDs of the middlebox attachments associated with the metering policy.

Type: Array of strings

Required: No

**state**

The state of the transit gateway metering policy.

Type: String

Valid Values: `available | deleted | pending | modifying | deleting`

Required: No

**TagSet.N**

The tags assigned to the transit gateway metering policy.

Type: Array of Tag objects

Required: No

**transitGatewayId**

The ID of the transit gateway associated with the metering policy.

Type: String

Required: No

**transitGatewayMeteringPolicyId**

The ID of the transit gateway metering policy.

Type: String

Required: No

**updateEffectiveAt**

The date and time when the metering policy update becomes effective.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMeteringPolicyEntry

Describes an entry in a transit gateway metering policy.

## Contents

**meteredAccount**

The AWS account ID to which the metered traffic is attributed.

Type: String

Valid Values: `source-attachment-owner | destination-attachment-owner | transit-gateway-owner`

Required: No

**meteringPolicyRule**

The metering policy rule that defines traffic matching criteria.

Type: TransitGatewayMeteringPolicyRule object

Required: No

**policyRuleNumber**

The rule number of the metering policy entry.

Type: String

Required: No

**state**

The state of the metering policy entry.

Type: String

Valid Values: `available | deleted`

Required: No

**updatedAt**

The date and time when the metering policy entry was last updated.

Type: Timestamp

Required: No

**updateEffectiveAt**

The date and time when the metering policy entry update becomes effective.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMeteringPolicyRule

Describes the traffic matching criteria for a transit gateway metering policy rule.

## Contents

**destinationCidrBlock**

The destination CIDR block for the rule.

Type: String

Required: No

**destinationPortRange**

The destination port range for the rule.

Type: String

Required: No

**destinationTransitGatewayAttachmentId**

The ID of the destination transit gateway attachment.

Type: String

Required: No

**destinationTransitGatewayAttachmentType**

The type of the destination transit gateway attachment. Note that the `tgw-peering` resource type has been deprecated. To configure metering policies for Connect, use the transport attachment type.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**protocol**

The protocol for the rule (1, 6, 17, etc.).

Type: String

Required: No

**sourceCidrBlock**

The source CIDR block for the rule.

Type: String

Required: No

**sourcePortRange**

The source port range for the rule.

Type: String

Required: No

**sourceTransitGatewayAttachmentId**

The ID of the source transit gateway attachment.

Type: String

Required: No

**sourceTransitGatewayAttachmentType**

The type of the source transit gateway attachment. Note that the `tgw-peering` resource type has been deprecated. To configure metering policies for Connect, use the transport attachment type.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastDeregisteredGroupMembers

Describes the deregistered transit gateway multicast group members.

## Contents

**DeregisteredNetworkInterfaceIds.N**

The network interface IDs of the deregistered members.

Type: Array of strings

Required: No

**groupIpAddress**

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

**transitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastDeregisteredGroupSources

Describes the deregistered transit gateway multicast group sources.

## Contents

**DeregisteredNetworkInterfaceIds.N**

The network interface IDs of the non-registered members.

Type: Array of strings

Required: No

**groupIpAddress**

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

**transitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastDomain

Describes the transit gateway multicast domain.

## Contents

**creationTime**

The time the transit gateway multicast domain was created.

Type: Timestamp

Required: No

**options**

The options for the transit gateway multicast domain.

Type: TransitGatewayMulticastDomainOptions object

Required: No

**ownerId**

The ID of the AWS account that owns the transit gateway multicast domain.

Type: String

Required: No

**state**

The state of the transit gateway multicast domain.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**TagSet.N**

The tags for the transit gateway multicast domain.

Type: Array of Tag objects

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

**transitGatewayMulticastDomainArn**

The Amazon Resource Name (ARN) of the transit gateway multicast domain.

Type: String

Required: No

**transitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastDomainAssociation

Describes the resources associated with the transit gateway multicast domain.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceOwnerId**

The ID of the AWS account that owns the transit gateway multicast domain association resource.

Type: String

Required: No

**resourceType**

The type of resource, for example a VPC attachment.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**subnet**

The subnet associated with the transit gateway multicast domain.

Type: SubnetAssociation object

Required: No

**transitGatewayAttachmentId**

The ID of the transit gateway attachment.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastDomainAssociations

Describes the multicast domain associations.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceOwnerId**

The ID of the AWS account that owns the resource.

Type: String

Required: No

**resourceType**

The type of resource, for example a VPC attachment.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**Subnets.N**

The subnets associated with the multicast domain.

Type: Array of SubnetAssociation objects

Required: No

**transitGatewayAttachmentId**

The ID of the transit gateway attachment.

Type: String

Required: No

**transitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastDomainOptions

Describes the options for a transit gateway multicast domain.

## Contents

**autoAcceptSharedAssociations**

Indicates whether to automatically cross-account subnet associations that are associated with the transit gateway multicast domain.

Type: String

Valid Values: `enable | disable`

Required: No

**igmpv2Support**

Indicates whether Internet Group Management Protocol (IGMP) version 2 is turned on for the transit gateway multicast domain.

Type: String

Valid Values: `enable | disable`

Required: No

**staticSourcesSupport**

Indicates whether support for statically configuring transit gateway multicast group sources is turned on.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastGroup

Describes the transit gateway multicast group resources.

## Contents

**groupIpAddress**

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

**groupMember**

Indicates that the resource is a transit gateway multicast group member.

Type: Boolean

Required: No

**groupSource**

Indicates that the resource is a transit gateway multicast group member.

Type: Boolean

Required: No

**memberType**

The member type (for example, `static`).

Type: String

Valid Values: `static | igmp`

Required: No

**networkInterfaceId**

The ID of the transit gateway attachment.

Type: String

Required: No

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceOwnerId**

The ID of the AWS account that owns the transit gateway multicast domain group resource.

Type: String

Required: No

**resourceType**

The type of resource, for example a VPC attachment.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**sourceType**

The source type.

Type: String

Valid Values: `static | igmp`

Required: No

**subnetId**

The ID of the subnet.

Type: String

Required: No

**transitGatewayAttachmentId**

The ID of the transit gateway attachment.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastRegisteredGroupMembers

Describes the registered transit gateway multicast group members.

## Contents

**groupIpAddress**

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

**RegisteredNetworkInterfaceIds.N**

The ID of the registered network interfaces.

Type: Array of strings

Required: No

**transitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayMulticastRegisteredGroupSources

Describes the members registered with the transit gateway multicast group.

## Contents

**groupIpAddress**

The IP address assigned to the transit gateway multicast group.

Type: String

Required: No

**RegisteredNetworkInterfaceIds.N**

The IDs of the network interfaces members registered with the transit gateway multicast group.

Type: Array of strings

Required: No

**transitGatewayMulticastDomainId**

The ID of the transit gateway multicast domain.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayOptions

Describes the options for a transit gateway.

## Contents

**amazonSideAsn**

A private Autonomous System Number (ASN) for the Amazon side of a BGP session. The range is 64512 to 65534 for 16-bit ASNs and 4200000000 to 4294967294 for 32-bit ASNs.

Type: Long

Required: No

**associationDefaultRouteTableId**

The ID of the default association route table.

Type: String

Required: No

**autoAcceptSharedAttachments**

Indicates whether attachment requests are automatically accepted.

Type: String

Valid Values: `enable | disable`

Required: No

**defaultRouteTableAssociation**

Indicates whether resource attachments are automatically associated with the default association route table. Enabled by default. Either `defaultRouteTableAssociation` or `defaultRouteTablePropagation` must be set to `enable` for AWS Transit Gateway to create the default transit gateway route table.

Type: String

Valid Values: `enable | disable`

Required: No

**defaultRouteTablePropagation**

Indicates whether resource attachments automatically propagate routes to the default propagation route table. Enabled by default. If `defaultRouteTablePropagation` is set to `enable`, AWS Transit Gateway creates the default transit gateway route table.

Type: String

Valid Values: `enable | disable`

Required: No

**dnsSupport**

Indicates whether DNS support is enabled.

Type: String

Valid Values: `enable | disable`

Required: No

**encryptionSupport**

Defines if the Transit Gateway supports VPC Encryption Control.

Type: EncryptionSupport object

Required: No

**multicastSupport**

Indicates whether multicast is enabled on the transit gateway

Type: String

Valid Values: `enable | disable`

Required: No

**propagationDefaultRouteTableId**

The ID of the default propagation route table.

Type: String

Required: No

**securityGroupReferencingSupport**

Enables you to reference a security group across VPCs attached to a transit gateway to simplify security group management.

This option is disabled by default.

Type: String

Valid Values: `enable | disable`

Required: No

**TransitGatewayCidrBlocks.N**

The transit gateway CIDR blocks.

Type: Array of strings

Required: No

**vpnEcmpSupport**

Indicates whether Equal Cost Multipath Protocol support is enabled.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPeeringAttachment

Describes the transit gateway peering attachment.

## Contents

**accepterTgwInfo**

Information about the accepter transit gateway.

Type: PeeringTgwInfo object

Required: No

**accepterTransitGatewayAttachmentId**

The ID of the accepter transit gateway attachment.

Type: String

Required: No

**creationTime**

The time the transit gateway peering attachment was created.

Type: Timestamp

Required: No

**options**

Details about the transit gateway peering attachment.

Type: TransitGatewayPeeringAttachmentOptions object

Required: No

**requesterTgwInfo**

Information about the requester transit gateway.

Type: PeeringTgwInfo object

Required: No

**state**

The state of the transit gateway peering attachment. Note that the `initiating` state has been deprecated.

Type: String

Valid Values: `initiating | initiatingRequest | pendingAcceptance | rollingBack | pending | available | modifying | deleting | deleted | failed | rejected | rejecting | failing`

Required: No

**status**

The status of the transit gateway peering attachment.

Type: PeeringAttachmentStatus object

Required: No

**TagSet.N**

The tags for the transit gateway peering attachment.

Type: Array of Tag objects

Required: No

**transitGatewayAttachmentId**

The ID of the transit gateway peering attachment.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPeeringAttachmentOptions

Describes dynamic routing for the transit gateway peering attachment.

## Contents

**dynamicRouting**

Describes whether dynamic routing is enabled or disabled for the transit gateway peering attachment.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPolicyRule

Describes a rule associated with a transit gateway policy.

## Contents

**destinationCidrBlock**

The destination CIDR block for the transit gateway policy rule.

Type: String

Required: No

**destinationPortRange**

The port range for the transit gateway policy rule. Currently this is set to * (all).

Type: String

Required: No

**metaData**

The meta data tags used for the transit gateway policy rule.

Type: TransitGatewayPolicyRuleMetaData object

Required: No

**protocol**

The protocol used by the transit gateway policy rule.

Type: String

Required: No

**sourceCidrBlock**

The source CIDR block for the transit gateway policy rule.

Type: String

Required: No

**sourcePortRange**

The port range for the transit gateway policy rule. Currently this is set to * (all).

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPolicyRuleMetaData

Describes the meta data tags associated with a transit gateway policy rule.

## Contents

**metaDataKey**

The key name for the transit gateway policy rule meta data tag.

Type: String

Required: No

**metaDataValue**

The value of the key for the transit gateway policy rule meta data tag.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPolicyTable

Describes a transit gateway policy table.

## Contents

**creationTime**

The timestamp when the transit gateway policy table was created.

Type: Timestamp

Required: No

**state**

The state of the transit gateway policy table

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**TagSet.N**

he key-value pairs associated with the transit gateway policy table.

Type: Array of Tag objects

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

**transitGatewayPolicyTableId**

The ID of the transit gateway policy table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPolicyTableAssociation

Describes a transit gateway policy table association.

## Contents

**resourceId**

The resource ID of the transit gateway attachment.

Type: String

Required: No

**resourceType**

The resource type for the transit gateway policy table association.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**state**

The state of the transit gateway policy table association.

Type: String

Valid Values: `associating | associated | disassociating | disassociated`

Required: No

**transitGatewayAttachmentId**

The ID of the transit gateway attachment.

Type: String

Required: No

**transitGatewayPolicyTableId**

The ID of the transit gateway policy table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPolicyTableEntry

Describes a transit gateway policy table entry

## Contents

**policyRule**

The policy rule associated with the transit gateway policy table.

Type: TransitGatewayPolicyRule object

Required: No

**policyRuleNumber**

The rule number for the transit gateway policy table entry.

Type: String

Required: No

**targetRouteTableId**

The ID of the target route table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPrefixListAttachment

Describes a transit gateway prefix list attachment.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceType**

The resource type. Note that the `tgw-peering` resource type has been deprecated.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**transitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPrefixListReference

Describes a prefix list reference.

## Contents

**blackhole**

Indicates whether traffic that matches this route is dropped.

Type: Boolean

Required: No

**prefixListId**

The ID of the prefix list.

Type: String

Required: No

**prefixListOwnerId**

The ID of the prefix list owner.

Type: String

Required: No

**state**

The state of the prefix list reference.

Type: String

Valid Values: `pending | available | modifying | deleting`

Required: No

**transitGatewayAttachment**

Information about the transit gateway attachment.

Type: TransitGatewayPrefixListAttachment object

Required: No

**transitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayPropagation

Describes route propagation.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceType**

The resource type. Note that the `tgw-peering` resource type has been deprecated.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**state**

The state.

Type: String

Valid Values: `enabling | enabled | disabling | disabled`

Required: No

**transitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

**transitGatewayRouteTableAnnouncementId**

The ID of the transit gateway route table announcement.

Type: String

Required: No

**transitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayRequestOptions

Describes the options for a transit gateway.

## Contents

**AmazonSideAsn**

A private Autonomous System Number (ASN) for the Amazon side of a BGP session. The range is 64512 to 65534 for 16-bit ASNs and 4200000000 to 4294967294 for 32-bit ASNs. The default is 64512.

Type: Long

Required: No

**AutoAcceptSharedAttachments**

Enable or disable automatic acceptance of attachment requests. Disabled by default.

Type: String

Valid Values: `enable | disable`

Required: No

**DefaultRouteTableAssociation**

Enable or disable automatic association with the default association route table. Enabled by default.

Type: String

Valid Values: `enable | disable`

Required: No

**DefaultRouteTablePropagation**

Enable or disable automatic propagation of routes to the default propagation route table. Enabled by default.

Type: String

Valid Values: `enable | disable`

Required: No

**DnsSupport**

Enable or disable DNS support. Enabled by default.

Type: String

Valid Values: `enable | disable`

Required: No

**MulticastSupport**

Indicates whether multicast is enabled on the transit gateway

Type: String

Valid Values: `enable | disable`

Required: No

**SecurityGroupReferencingSupport**

Enables you to reference a security group across VPCs attached to a transit gateway to simplify security group management.

This option is disabled by default.

For more information about security group referencing, see Security group referencing in the *AWS Transit Gateways Guide*.

Type: String

Valid Values: `enable | disable`

Required: No

**TransitGatewayCidrBlocks.N**

One or more IPv4 or IPv6 CIDR blocks for the transit gateway. Must be a size /24 CIDR block or larger for IPv4, or a size /64 CIDR block or larger for IPv6.

Type: Array of strings

Required: No

**VpnEcmpSupport**

Enable or disable Equal Cost Multipath Protocol support. Enabled by default.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayRoute

Describes a route for a transit gateway route table.

## Contents

**destinationCidrBlock**

The CIDR block used for destination matches.

Type: String

Required: No

**prefixListId**

The ID of the prefix list used for destination matches.

Type: String

Required: No

**state**

The state of the route.

Type: String

Valid Values: `pending | active | blackhole | deleting | deleted`

Required: No

**TransitGatewayAttachments.N**

The attachments.

Type: Array of TransitGatewayRouteAttachment objects

Required: No

**transitGatewayRouteTableAnnouncementId**

The ID of the transit gateway route table announcement.

Type: String

Required: No

**type**

The route type.

Type: String

Valid Values: `static | propagated`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayRouteAttachment

Describes a route attachment.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceType**

The resource type. Note that the `tgw-peering` resource type has been deprecated.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**transitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayRouteTable

Describes a transit gateway route table.

## Contents

**creationTime**

The creation time.

Type: Timestamp

Required: No

**defaultAssociationRouteTable**

Indicates whether this is the default association route table for the transit gateway.

Type: Boolean

Required: No

**defaultPropagationRouteTable**

Indicates whether this is the default propagation route table for the transit gateway.

Type: Boolean

Required: No

**state**

The state of the transit gateway route table.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**TagSet.N**

Any tags assigned to the route table.

Type: Array of Tag objects

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

**transitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayRouteTableAnnouncement

Describes a transit gateway route table announcement.

## Contents

**announcementDirection**

The direction for the route table announcement.

Type: String

Valid Values: `outgoing | incoming`

Required: No

**coreNetworkId**

The ID of the core network for the transit gateway route table announcement.

Type: String

Required: No

**creationTime**

The timestamp when the transit gateway route table announcement was created.

Type: Timestamp

Required: No

**peerCoreNetworkId**

The ID of the core network ID for the peer.

Type: String

Required: No

**peeringAttachmentId**

The ID of the peering attachment.

Type: String

Required: No

**peerTransitGatewayId**

The ID of the peer transit gateway.

Type: String

Required: No

**state**

The state of the transit gateway announcement.

Type: String

Valid Values: `available | pending | failing | failed | deleting | deleted`

Required: No

**TagSet.N**

The key-value pairs associated with the route table announcement.

Type: Array of Tag objects

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

**transitGatewayRouteTableAnnouncementId**

The ID of the transit gateway route table announcement.

Type: String

Required: No

**transitGatewayRouteTableId**

The ID of the transit gateway route table.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayRouteTableAssociation

Describes an association between a route table and a resource attachment.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceType**

The resource type. Note that the `tgw-peering` resource type has been deprecated.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**state**

The state of the association.

Type: String

Valid Values: `associating | associated | disassociating | disassociated`

Required: No

**transitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayRouteTablePropagation

Describes a route table propagation.

## Contents

**resourceId**

The ID of the resource.

Type: String

Required: No

**resourceType**

The type of resource. Note that the `tgw-peering` resource type has been deprecated.

Type: String

Valid Values: `vpc | vpn | vpn-concentrator | direct-connect-gateway | connect | peering | tgw-peering | client-vpn`

Required: No

**state**

The state of the resource.

Type: String

Valid Values: `enabling | enabled | disabling | disabled`

Required: No

**transitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

**transitGatewayRouteTableAnnouncementId**

The ID of the transit gateway route table announcement.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayRouteTableRoute

Describes a route in a transit gateway route table.

## Contents

**attachmentId**

The ID of the route attachment.

Type: String

Required: No

**destinationCidr**

The CIDR block used for destination matches.

Type: String

Required: No

**prefixListId**

The ID of the prefix list.

Type: String

Required: No

**resourceId**

The ID of the resource for the route attachment.

Type: String

Required: No

**resourceType**

The resource type for the route attachment.

Type: String

Required: No

**routeOrigin**

The route origin. The following are the possible values:

- static
- propagated

Type: String

Required: No

**state**

The state of the route.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayVpcAttachment

Describes a VPC attachment.

## Contents

**creationTime**

The creation time.

Type: Timestamp

Required: No

**options**

The VPC attachment options.

Type: TransitGatewayVpcAttachmentOptions object

Required: No

**state**

The state of the VPC attachment. Note that the `initiating` state has been deprecated.

Type: String

Valid Values: `initiating | initiatingRequest | pendingAcceptance | rollingBack | pending | available | modifying | deleting | deleted | failed | rejected | rejecting | failing`

Required: No

**SubnetIds.N**

The IDs of the subnets.

Type: Array of strings

Required: No

**TagSet.N**

The tags for the VPC attachment.

Type: Array of Tag objects

Required: No

**transitGatewayAttachmentId**

The ID of the attachment.

Type: String

Required: No

**transitGatewayId**

The ID of the transit gateway.

Type: String

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

**vpcOwnerId**

The ID of the AWS account that owns the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TransitGatewayVpcAttachmentOptions

Describes the VPC attachment options.

## Contents

**applianceModeSupport**

Indicates whether appliance mode support is enabled.

Type: String

Valid Values: `enable | disable`

Required: No

**dnsSupport**

Indicates whether DNS support is enabled.

Type: String

Valid Values: `enable | disable`

Required: No

**ipv6Support**

Indicates whether IPv6 support is disabled.

Type: String

Valid Values: `enable | disable`

Required: No

**securityGroupReferencingSupport**

Enables you to reference a security group across VPCs attached to a transit gateway to simplify security group management.

This option is enabled by default.

For more information about security group referencing, see Security group referencing in the *AWS Transit Gateways Guide*.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TrunkInterfaceAssociation

Information about an association between a branch network interface with a trunk network interface.

## Contents

**associationId**

The ID of the association.

Type: String

Required: No

**branchInterfaceId**

The ID of the branch network interface.

Type: String

Required: No

**greKey**

The application key when you use the GRE protocol.

Type: Integer

Required: No

**interfaceProtocol**

The interface protocol. Valid values are `VLAN` and `GRE`.

Type: String

Valid Values: `VLAN | GRE`

Required: No

**TagSet.N**

The tags for the trunk interface association.

Type: Array of Tag objects

Required: No

**trunkInterfaceId**

The ID of the trunk network interface.

Type: String

Required: No

**vlanId**

The ID of the VLAN when you use the VLAN protocol.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# TunnelOption

The VPN tunnel options.

## Contents

**dpdTimeoutAction**

The action to take after a DPD timeout occurs.

Type: String

Required: No

**dpdTimeoutSeconds**

The number of seconds after which a DPD timeout occurs.

Type: Integer

Required: No

**enableTunnelLifecycleControl**

Status of tunnel endpoint lifecycle control feature.

Type: Boolean

Required: No

**IkeVersionSet.N**

The IKE versions that are permitted for the VPN tunnel.

Type: Array of IKEVersionsListValue objects

Required: No

**logOptions**

Options for logging VPN tunnel activity.

Type: VpnTunnelLogOptions object

Required: No

**outsideIpAddress**

The external IP address of the VPN tunnel.

Type: String

Required: No

**Phase1DHGroupNumberSet.N**

The permitted Diffie-Hellman group numbers for the VPN tunnel for phase 1 IKE negotiations.

Type: Array of Phase1DHGroupNumbersListValue objects

Required: No

**Phase1EncryptionAlgorithmSet.N**

The permitted encryption algorithms for the VPN tunnel for phase 1 IKE negotiations.

Type: Array of Phase1EncryptionAlgorithmsListValue objects

Required: No

**Phase1IntegrityAlgorithmSet.N**

The permitted integrity algorithms for the VPN tunnel for phase 1 IKE negotiations.

Type: Array of Phase1IntegrityAlgorithmsListValue objects

Required: No

**phase1LifetimeSeconds**

The lifetime for phase 1 of the IKE negotiation, in seconds.

Type: Integer

Required: No

**Phase2DHGroupNumberSet.N**

The permitted Diffie-Hellman group numbers for the VPN tunnel for phase 2 IKE negotiations.

Type: Array of Phase2DHGroupNumbersListValue objects

Required: No

**Phase2EncryptionAlgorithmSet.N**

The permitted encryption algorithms for the VPN tunnel for phase 2 IKE negotiations.

Type: Array of Phase2EncryptionAlgorithmsListValue objects

Required: No

**Phase2IntegrityAlgorithmSet.N**

The permitted integrity algorithms for the VPN tunnel for phase 2 IKE negotiations.

Type: Array of Phase2IntegrityAlgorithmsListValue objects

Required: No

**phase2LifetimeSeconds**

The lifetime for phase 2 of the IKE negotiation, in seconds.

Type: Integer

Required: No

**preSharedKey**

The pre-shared key (PSK) to establish initial authentication between the virtual private gateway and the customer gateway.

Type: String

Required: No

**rekeyFuzzPercentage**

The percentage of the rekey window determined by `RekeyMarginTimeSeconds` during which the rekey time is randomly selected.

Type: Integer

Required: No

**rekeyMarginTimeSeconds**

The margin time, in seconds, before the phase 2 lifetime expires, during which the AWS side of the VPN connection performs an IKE rekey.

Type: Integer

Required: No

**replayWindowSize**

The number of packets in an IKE replay window.

Type: Integer

Required: No

**startupAction**

The action to take when the establishing the VPN tunnels for a VPN connection.

Type: String

Required: No

**tunnelInsideCidr**

The range of inside IPv4 addresses for the tunnel.

Type: String

Required: No

**tunnelInsideIpv6Cidr**

The range of inside IPv6 addresses for the tunnel.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# UnsuccessfulInstanceCreditSpecificationItem

Describes the burstable performance instance whose credit option for CPU usage was not modified.

## Contents

**error**

The applicable error for the burstable performance instance whose credit option for CPU usage was not modified.

Type: UnsuccessfulInstanceCreditSpecificationItemError object

Required: No

**instanceId**

The ID of the instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# UnsuccessfulInstanceCreditSpecificationItemError

Information about the error for the burstable performance instance whose credit option for CPU usage was not modified.

## Contents

**code**

The error code.

Type: String

Valid Values: `InvalidInstanceID.Malformed | InvalidInstanceID.NotFound | IncorrectInstanceState | InstanceCreditSpecification.NotSupported`

Required: No

**message**

The applicable error message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# UnsuccessfulItem

Information about items that were not successfully processed in a batch call.

## Contents

**error**

Information about the error.

Type: UnsuccessfulItemError object

Required: No

**resourceId**

The ID of the resource.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# UnsuccessfulItemError

Information about the error that occurred. For more information about errors, see Error codes.

## Contents

**code**

The error code.

Type: String

Required: No

**message**

The error message accompanying the error code.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# UserBucket

Describes the Amazon S3 bucket for the disk image.

## Contents

**S3Bucket**

The name of the Amazon S3 bucket where the disk image is located.

Type: String

Required: No

**S3Key**

The file name of the disk image.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# UserBucketDetails

Describes the Amazon S3 bucket for the disk image.

## Contents

**s3Bucket**

The Amazon S3 bucket from which the disk image was created.

Type: String

Required: No

**s3Key**

The file name of the disk image.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# UserData

Describes the user data for an instance.

## Contents

### Data

The user data. If you are using an AWS SDK or command line tool, Base64-encoding is performed for you, and you can load the text from a file. Otherwise, you must provide Base64-encoded text.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# UserIdGroupPair

Describes a security group and AWS account ID pair.

## Contents

**Description** (request), **description** (response)

A description for the security group rule that references this user ID group pair.

Constraints: Up to 255 characters in length. Allowed characters are a-z, A-Z, 0-9, spaces, and ._-:/()#,@[]+=;{}!$*

Type: String

Required: No

**GroupId** (request), **groupId** (response)

The ID of the security group.

Type: String

Required: No

**GroupName** (request), **groupName** (response)

[Default VPC] The name of the security group. For a security group in a nondefault VPC, use the security group ID.

For a referenced security group in another VPC, this value is not returned if the referenced security group is deleted.

Type: String

Required: No

**PeeringStatus** (request), **peeringStatus** (response)

The status of a VPC peering connection, if applicable.

Type: String

Required: No

**UserId** (request), **userId** (response)

The ID of an AWS account.

For a referenced security group in another VPC, the account ID of the referenced security group is returned in the response. If the referenced security group is deleted, this value is not returned.

Type: String

Required: No

**VpcId** (request), **vpcId** (response)

The ID of the VPC for the referenced security group, if applicable.

Type: String

Required: No

**VpcPeeringConnectionId** (request), **vpcPeeringConnectionId** (response)

The ID of the VPC peering connection, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ValidationError

The error code and error message that is returned for a parameter or parameter combination that is not valid when a new launch template or new version of a launch template is created.

## Contents

**code**

The error code that indicates why the parameter or parameter combination is not valid. For more information about error codes, see Error codes.

Type: String

Required: No

**message**

The error message that describes why the parameter or parameter combination is not valid. For more information about error messages, see Error codes.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# ValidationWarning

The error codes and error messages that are returned for the parameters or parameter combinations that are not valid when a new launch template or new version of a launch template is created.

## Contents

**ErrorSet.N**

The error codes and error messages.

Type: Array of ValidationError objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VCpuCountRange

The minimum and maximum number of vCPUs.

## Contents

**Max** (request), **max** (response)

The maximum number of vCPUs. If this parameter is not specified, there is no maximum limit.

Type: Integer

Required: No

**Min** (request), **min** (response)

The minimum number of vCPUs. If the value is `0`, there is no minimum limit.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VCpuCountRangeRequest

The minimum and maximum number of vCPUs.

## Contents

**Min**

The minimum number of vCPUs. To specify no minimum limit, specify `0`.

Type: Integer

Required: Yes

**Max**

The maximum number of vCPUs. To specify no maximum limit, omit this parameter.

Type: Integer

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VCpuInfo

Describes the vCPU configurations for the instance type.

## Contents

**defaultCores**

The default number of cores for the instance type.

Type: Integer

Required: No

**defaultThreadsPerCore**

The default number of threads per core for the instance type.

Type: Integer

Required: No

**defaultVCpus**

The default number of vCPUs for the instance type.

Type: Integer

Required: No

**ValidCores.N**

The valid number of cores that can be configured for the instance type.

Type: Array of integers

Required: No

**ValidThreadsPerCore.N**

The valid number of threads per core that can be configured for the instance type.

Type: Array of integers

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessEndpoint

An AWS Verified Access endpoint specifies the application that AWS Verified Access provides access to. It must be attached to an AWS Verified Access group. An AWS Verified Access endpoint must also have an attached access policy before you attached it to a group.

## Contents

**applicationDomain**

The DNS name for users to reach your application.

Type: String

Required: No

**attachmentType**

The type of attachment used to provide connectivity between the AWS Verified Access endpoint and the application.

Type: String

Valid Values: vpc

Required: No

**cidrOptions**

The options for a CIDR endpoint.

Type: VerifiedAccessEndpointCidrOptions object

Required: No

**creationTime**

The creation time.

Type: String

Required: No

**deletionTime**

The deletion time.

Type: String

Required: No

**description**

A description for the AWS Verified Access endpoint.

Type: String

Required: No

**deviceValidationDomain**

Returned if endpoint has a device trust provider attached.

Type: String

Required: No

**domainCertificateArn**

The ARN of a public TLS/SSL certificate imported into or created with ACM.

Type: String

Required: No

**endpointDomain**

A DNS name that is generated for the endpoint.

Type: String

Required: No

**endpointType**

The type of AWS Verified Access endpoint. Incoming application requests will be sent to an IP address, load balancer or a network interface depending on the endpoint type specified.

Type: String

Valid Values: `load-balancer | network-interface | rds | cidr`

Required: No

**lastUpdatedTime**

The last updated time.

Type: String

Required: No

**loadBalancerOptions**

The load balancer details if creating the AWS Verified Access endpoint as `load-balancer`type.

Type: VerifiedAccessEndpointLoadBalancerOptions object

Required: No

**networkInterfaceOptions**

The options for network-interface type endpoint.

Type: VerifiedAccessEndpointEniOptions object

Required: No

**rdsOptions**

The options for an RDS endpoint.

Type: VerifiedAccessEndpointRdsOptions object

Required: No

**SecurityGroupIdSet.N**

The IDs of the security groups for the endpoint.

Type: Array of strings

Required: No

**sseSpecification**

The options in use for server side encryption.

Type: VerifiedAccessSseSpecificationResponse object

Required: No

**status**

The endpoint status.

Type: VerifiedAccessEndpointStatus object

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

**verifiedAccessEndpointId**

The ID of the AWS Verified Access endpoint.

Type: String

Required: No

**verifiedAccessGroupId**

The ID of the AWS Verified Access group.

Type: String

Required: No

**verifiedAccessInstanceId**

The ID of the AWS Verified Access instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessEndpointCidrOptions

Describes the CIDR options for a Verified Access endpoint.

## Contents

**cidr**

The CIDR.

Type: String

Required: No

**PortRangeSet.N**

The port ranges.

Type: Array of VerifiedAccessEndpointPortRange objects

Required: No

**protocol**

The protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

**SubnetIdSet.N**

The IDs of the subnets.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessEndpointEniOptions

Options for a network-interface type endpoint.

## Contents

**networkInterfaceId**

The ID of the network interface.

Type: String

Required: No

**port**

The IP port number.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**PortRangeSet.N**

The port ranges.

Type: Array of VerifiedAccessEndpointPortRange objects

Required: No

**protocol**

The IP protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessEndpointLoadBalancerOptions

Describes a load balancer when creating an AWS Verified Access endpoint using the `load-balancer` type.

## Contents

**loadBalancerArn**

The ARN of the load balancer.

Type: String

Required: No

**port**

The IP port number.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**PortRangeSet.N**

The port ranges.

Type: Array of VerifiedAccessEndpointPortRange objects

Required: No

**protocol**

The IP protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

**SubnetIdSet.N**

The IDs of the subnets.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessEndpointPortRange

Describes a port range.

## Contents

**fromPort**

The start of the port range.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**toPort**

The end of the port range.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessEndpointRdsOptions

Describes the RDS options for a Verified Access endpoint.

## Contents

**port**

The port.

Type: Integer

Valid Range: Minimum value of 1. Maximum value of 65535.

Required: No

**protocol**

The protocol.

Type: String

Valid Values: `http | https | tcp`

Required: No

**rdsDbClusterArn**

The ARN of the DB cluster.

Type: String

Required: No

**rdsDbInstanceArn**

The ARN of the RDS instance.

Type: String

Required: No

**rdsDbProxyArn**

The ARN of the RDS proxy.

Type: String

Required: No

**rdsEndpoint**

The RDS endpoint.

Type: String

Required: No

**SubnetIdSet.N**

The IDs of the subnets.

Type: Array of strings

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessEndpointStatus

Describes the status of a Verified Access endpoint.

## Contents

**code**

The status code of the Verified Access endpoint.

Type: String

Valid Values: `pending | active | updating | deleting | deleted`

Required: No

**message**

The status message of the Verified Access endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessEndpointTarget

Describes the targets for the specified Verified Access endpoint.

## Contents

**verifiedAccessEndpointId**

The ID of the Verified Access endpoint.

Type: String

Required: No

**verifiedAccessEndpointTargetDns**

The DNS name of the target.

Type: String

Required: No

**verifiedAccessEndpointTargetIpAddress**

The IP address of the target.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessGroup

Describes a Verified Access group.

## Contents

**creationTime**

The creation time.

Type: String

Required: No

**deletionTime**

The deletion time.

Type: String

Required: No

**description**

A description for the AWS Verified Access group.

Type: String

Required: No

**lastUpdatedTime**

The last updated time.

Type: String

Required: No

**owner**

The AWS account number that owns the group.

Type: String

Required: No

**sseSpecification**

The options in use for server side encryption.

Type: VerifiedAccessSseSpecificationResponse object

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

**verifiedAccessGroupArn**

The ARN of the Verified Access group.

Type: String

Required: No

**verifiedAccessGroupId**

The ID of the Verified Access group.

Type: String

Required: No

**verifiedAccessInstanceId**

The ID of the AWS Verified Access instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessInstance

Describes a Verified Access instance.

## Contents

**cidrEndpointsCustomSubDomain**

The custom subdomain.

Type: VerifiedAccessInstanceCustomSubDomain object

Required: No

**creationTime**

The creation time.

Type: String

Required: No

**description**

A description for the AWS Verified Access instance.

Type: String

Required: No

**fipsEnabled**

Indicates whether support for Federal Information Processing Standards (FIPS) is enabled on the instance.

Type: Boolean

Required: No

**lastUpdatedTime**

The last updated time.

Type: String

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

**verifiedAccessInstanceId**

The ID of the AWS Verified Access instance.

Type: String

Required: No

**VerifiedAccessTrustProviderSet.N**

The IDs of the AWS Verified Access trust providers.

Type: Array of VerifiedAccessTrustProviderCondensed objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessInstanceCustomSubDomain

Describes a custom subdomain for a network CIDR endpoint for Verified Access.

## Contents

**NameserverSet.N**

The name servers.

Type: Array of strings

Required: No

**subDomain**

The subdomain.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessInstanceLoggingConfiguration

Describes logging options for an AWS Verified Access instance.

## Contents

**accessLogs**

Details about the logging options.

Type: VerifiedAccessLogs object

Required: No

**verifiedAccessInstanceId**

The ID of the AWS Verified Access instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessInstanceOpenVpnClientConfiguration

Describes a set of routes.

## Contents

**config**

The base64-encoded Open VPN client configuration.

Type: String

Required: No

**RouteSet.N**

The routes.

Type: Array of VerifiedAccessInstanceOpenVpnClientConfigurationRoute objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessInstanceOpenVpnClientConfigurationRoute

Describes a route.

## Contents

**cidr**

The CIDR block.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessInstanceUserTrustProviderClientConfiguration

Describes the trust provider.

## Contents

**authorizationEndpoint**

The authorization endpoint of the IdP.

Type: String

Required: No

**clientId**

The OAuth 2.0 client identifier.

Type: String

Required: No

**clientSecret**

The OAuth 2.0 client secret.

Type: String

Required: No

**issuer**

The OIDC issuer identifier of the IdP.

Type: String

Required: No

**pkceEnabled**

Indicates whether Proof of Key Code Exchange (PKCE) is enabled.

Type: Boolean

Required: No

**publicSigningKeyEndpoint**

The public signing key endpoint.

Type: String

Required: No

**scopes**

The set of user claims to be requested from the IdP.

Type: String

Required: No

**tokenEndpoint**

The token endpoint of the IdP.

Type: String

Required: No

**type**

The trust provider type.

Type: String

Valid Values: `iam-identity-center | oidc`

Required: No

**userInfoEndpoint**

The user info endpoint of the IdP.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogCloudWatchLogsDestination

Options for CloudWatch Logs as a logging destination.

## Contents

**deliveryStatus**

The delivery status for access logs.

Type: VerifiedAccessLogDeliveryStatus object

Required: No

**enabled**

Indicates whether logging is enabled.

Type: Boolean

Required: No

**logGroup**

The ID of the CloudWatch Logs log group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogCloudWatchLogsDestinationOptions

Options for CloudWatch Logs as a logging destination.

## Contents

**Enabled**

Indicates whether logging is enabled.

Type: Boolean

Required: Yes

**LogGroup**

The ID of the CloudWatch Logs log group.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogDeliveryStatus

Describes a log delivery status.

## Contents

**code**

The status code.

Type: String

Valid Values: `success | failed`

Required: No

**message**

The status message.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogKinesisDataFirehoseDestination

Options for Kinesis as a logging destination.

## Contents

**deliveryStatus**

The delivery status.

Type: VerifiedAccessLogDeliveryStatus object

Required: No

**deliveryStream**

The ID of the delivery stream.

Type: String

Required: No

**enabled**

Indicates whether logging is enabled.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogKinesisDataFirehoseDestinationOptions

Describes Amazon Kinesis Data Firehose logging options.

## Contents

**Enabled**

Indicates whether logging is enabled.

Type: Boolean

Required: Yes

**DeliveryStream**

The ID of the delivery stream.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogOptions

Options for Verified Access logs.

## Contents

**CloudWatchLogs**

Sends Verified Access logs to CloudWatch Logs.

Type: VerifiedAccessLogCloudWatchLogsDestinationOptions object

Required: No

**IncludeTrustContext**

Indicates whether to include trust data sent by trust providers in the logs.

Type: Boolean

Required: No

**KinesisDataFirehose**

Sends Verified Access logs to Kinesis.

Type: VerifiedAccessLogKinesisDataFirehoseDestinationOptions object

Required: No

**LogVersion**

The logging version.

Valid values: `ocsf-0.1` | `ocsf-1.0.0-rc.2`

Type: String

Required: No

**S3**

Sends Verified Access logs to Amazon S3.

Type: VerifiedAccessLogS3DestinationOptions object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogs

Describes the options for Verified Access logs.

## Contents

**cloudWatchLogs**

CloudWatch Logs logging destination.

Type: VerifiedAccessLogCloudWatchLogsDestination object

Required: No

**includeTrustContext**

Indicates whether trust data is included in the logs.

Type: Boolean

Required: No

**kinesisDataFirehose**

Kinesis logging destination.

Type: VerifiedAccessLogKinesisDataFirehoseDestination object

Required: No

**logVersion**

The log version.

Type: String

Required: No

**s3**

Amazon S3 logging options.

Type: VerifiedAccessLogS3Destination object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogS3Destination

Options for Amazon S3 as a logging destination.

## Contents

**bucketName**

The bucket name.

Type: String

Required: No

**bucketOwner**

The AWS account number that owns the bucket.

Type: String

Required: No

**deliveryStatus**

The delivery status.

Type: VerifiedAccessLogDeliveryStatus object

Required: No

**enabled**

Indicates whether logging is enabled.

Type: Boolean

Required: No

**prefix**

The bucket prefix.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessLogS3DestinationOptions

Options for Amazon S3 as a logging destination.

## Contents

**Enabled**

Indicates whether logging is enabled.

Type: Boolean

Required: Yes

**BucketName**

The bucket name.

Type: String

Required: No

**BucketOwner**

The ID of the AWS account that owns the Amazon S3 bucket.

Type: String

Required: No

**Prefix**

The bucket prefix.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessSseSpecificationRequest

AWS Verified Access provides server side encryption by default to data at rest using AWS-owned KMS keys. You also have the option of using customer managed KMS keys, which can be specified using the options below.

## Contents

**CustomerManagedKeyEnabled**

Enable or disable the use of customer managed KMS keys for server side encryption.

Valid values: `True` | `False`

Type: Boolean

Required: No

**KmsKeyArn**

The ARN of the KMS key.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessSseSpecificationResponse

The options in use for server side encryption.

## Contents

**customerManagedKeyEnabled**

Indicates whether customer managed KMS keys are in use for server side encryption.

Valid values: `True` | `False`

Type: Boolean

Required: No

**kmsKeyArn**

The ARN of the KMS key.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessTrustProvider

Describes a Verified Access trust provider.

## Contents

**creationTime**

The creation time.

Type: String

Required: No

**description**

A description for the AWS Verified Access trust provider.

Type: String

Required: No

**deviceOptions**

The options for device-identity trust provider.

Type: DeviceOptions object

Required: No

**deviceTrustProviderType**

The type of device-based trust provider.

Type: String

Valid Values: `jamf | crowdstrike | jumpcloud`

Required: No

**lastUpdatedTime**

The last updated time.

Type: String

Required: No

**nativeApplicationOidcOptions**

The OpenID Connect (OIDC) options.

Type: NativeApplicationOidcOptions object

Required: No

**oidcOptions**

The options for an OpenID Connect-compatible user-identity trust provider.

Type: OidcOptions object

Required: No

**policyReferenceName**

The identifier to be used when working with policy rules.

Type: String

Required: No

**sseSpecification**

The options in use for server side encryption.

Type: VerifiedAccessSseSpecificationResponse object

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

**trustProviderType**

The type of Verified Access trust provider.

Type: String

Valid Values: `user | device`

Required: No

**userTrustProviderType**

The type of user-based trust provider.

Type: String

Valid Values: `iam-identity-center | oidc`

Required: No

**verifiedAccessTrustProviderId**

The ID of the AWS Verified Access trust provider.

Type: String

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VerifiedAccessTrustProviderCondensed

Condensed information about a trust provider.

## Contents

**description**

The description of trust provider.

Type: String

Required: No

**deviceTrustProviderType**

The type of device-based trust provider.

Type: String

Valid Values: `jamf | crowdstrike | jumpcloud`

Required: No

**trustProviderType**

The type of trust provider (user- or device-based).

Type: String

Valid Values: `user | device`

Required: No

**userTrustProviderType**

The type of user-based trust provider.

Type: String

Valid Values: `iam-identity-center | oidc`

Required: No

**verifiedAccessTrustProviderId**

The ID of the trust provider.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VgwTelemetry

Describes telemetry for a VPN tunnel.

## Contents

**acceptedRouteCount**

The number of accepted routes.

Type: Integer

Required: No

**certificateArn**

The Amazon Resource Name (ARN) of the VPN tunnel endpoint certificate.

Type: String

Required: No

**lastStatusChange**

The date and time of the last change in status. This field is updated when changes in IKE (Phase 1), IPSec (Phase 2), or BGP status are detected.

Type: Timestamp

Required: No

**outsideIpAddress**

The Internet-routable IP address of the virtual private gateway's outside interface.

Type: String

Required: No

**status**

The status of the VPN tunnel.

Type: String

Valid Values: `UP | DOWN`

Required: No

**statusMessage**

If an error occurs, a description of the error.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Volume

Describes a volume.

## Contents

**AttachmentSet.N**

> **Note**
>
> This parameter is not returned by CreateVolume.

Information about the volume attachments.

Type: Array of VolumeAttachment objects

Required: No

**availabilityZone**

The Availability Zone for the volume.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone for the volume.

Type: String

Required: No

**createTime**

The time stamp when volume creation was initiated.

Type: Timestamp

Required: No

**encrypted**

Indicates whether the volume is encrypted.

Type: Boolean

Required: No

**fastRestored**

> **Note**
>
> This parameter is not returned by CreateVolume.

Indicates whether the volume was created using fast snapshot restore.

Type: Boolean

Required: No

**iops**

The number of I/O operations per second (IOPS). For `gp3`, `io1`, and `io2` volumes, this represents the number of IOPS that are provisioned for the volume. For `gp2` volumes, this represents the baseline performance of the volume and the rate at which the volume accumulates I/O credits for bursting.

Type: Integer

Required: No

**kmsKeyId**

The Amazon Resource Name (ARN) of the AWS KMS key that was used to protect the volume encryption key for the volume.

Type: String

Required: No

**multiAttachEnabled**

Indicates whether Amazon EBS Multi-Attach is enabled.

Type: Boolean

Required: No

**operator**

The service provider that manages the volume.

Type: OperatorResponse object

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost.

Type: String

Required: No

**size**

The size of the volume, in GiBs.

Type: Integer

Required: No

**snapshotId**

The snapshot from which the volume was created, if applicable.

Type: String

Required: No

**sourceVolumeId**

The ID of the source volume from which the volume copy was created. Only for volume copies.

Type: String

Required: No

**sseType**

> **Note**
>
> This parameter is not returned by CreateVolume.

Reserved for future use.

Type: String

Valid Values: `sse-ebs | sse-kms | none`

Required: No

**status**

The volume state.

Type: String

Valid Values: `creating | available | in-use | deleting | deleted | error`

Required: No

**TagSet.N**

Any tags assigned to the volume.

Type: Array of Tag objects

Required: No

**throughput**

The throughput that the volume supports, in MiB/s.

Type: Integer

Required: No

**volumeId**

The ID of the volume.

Type: String

Required: No

**volumeInitializationRate**

The Amazon EBS Provisioned Rate for Volume Initialization (volume initialization rate) specified for the volume during creation, in MiB/s. If no volume initialization rate was specified, the value is `null`.

Type: Integer

Required: No

**volumeType**

The volume type.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeAttachment

Describes volume attachment details.

## Contents

**associatedResource**

The ARN of the AWS-managed resource to which the volume is attached.

Type: String

Required: No

**attachTime**

The time stamp when the attachment initiated.

Type: Timestamp

Required: No

**deleteOnTermination**

Indicates whether the EBS volume is deleted on instance termination.

Type: Boolean

Required: No

**device**

The device name.

If the volume is attached to an AWS-managed resource, this parameter returns `null`.

Type: String

Required: No

**ebsCardIndex**

The index of the EBS card. Some instance types support multiple EBS cards. The default EBS card index is 0.

Type: Integer

Required: No

**instanceId**

The ID of the instance.

If the volume is attached to an AWS-managed resource, this parameter returns `null`.

Type: String

Required: No

**instanceOwningService**

The service principal of the AWS service that owns the underlying resource to which the volume is attached.

This parameter is returned only for volumes that are attached to AWS-managed resources.

Type: String

Required: No

**status**

The attachment state of the volume.

Type: String

Valid Values: `attaching | attached | detaching | detached | busy`

Required: No

**volumeId**

The ID of the volume.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeDetail

Describes an EBS volume.

## Contents

**Size**

The size of the volume, in GiB.

Type: Long

Required: Yes

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeModification

Describes the modification status of an EBS volume.

## Contents

**endTime**

The modification completion or failure time.

Type: Timestamp

Required: No

**modificationState**

The current modification state.

Type: String

Valid Values: `modifying | optimizing | completed | failed`

Required: No

**originalIops**

The original IOPS rate of the volume.

Type: Integer

Required: No

**originalMultiAttachEnabled**

The original setting for Amazon EBS Multi-Attach.

Type: Boolean

Required: No

**originalSize**

The original size of the volume, in GiB.

Type: Integer

Required: No

**originalThroughput**

The original throughput of the volume, in MiB/s.

Type: Integer

Required: No

**originalVolumeType**

The original EBS volume type of the volume.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

**progress**

The modification progress, from 0 to 100 percent complete.

Type: Long

Required: No

**startTime**

The modification start time.

Type: Timestamp

Required: No

**statusMessage**

A status message about the modification progress or failure.

Type: String

Required: No

**targetIops**

The target IOPS rate of the volume.

Type: Integer

Required: No

**targetMultiAttachEnabled**

The target setting for Amazon EBS Multi-Attach.

Type: Boolean

Required: No

**targetSize**

The target size of the volume, in GiB.

Type: Integer

Required: No

**targetThroughput**

The target throughput of the volume, in MiB/s.

Type: Integer

Required: No

**targetVolumeType**

The target EBS volume type of the volume.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

**volumeId**

The ID of the volume.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeRecycleBinInfo

Information about a volume that is currently in the Recycle Bin.

## Contents

**availabilityZone**

The Availability Zone for the volume.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone for the volume.

Type: String

Required: No

**createTime**

The time stamp when volume creation was initiated.

Type: Timestamp

Required: No

**iops**

The number of I/O operations per second (IOPS) for the volume.

Type: Integer

Required: No

**operator**

The service provider that manages the volume.

Type: OperatorResponse object

Required: No

**outpostArn**

The ARN of the Outpost on which the volume is stored. For more information, see Amazon EBS volumes on Outposts in the *Amazon EBS User Guide*.

Type: String

Required: No

**recycleBinEnterTime**

The date and time when the volume entered the Recycle Bin.

Type: Timestamp

Required: No

**recycleBinExitTime**

The date and time when the volume is to be permanently deleted from the Recycle Bin.

Type: Timestamp

Required: No

**size**

The size of the volume, in GiB.

Type: Integer

Required: No

**snapshotId**

The snapshot from which the volume was created, if applicable.

Type: String

Required: No

**sourceVolumeId**

The ID of the source volume.

Type: String

Required: No

**state**

The state of the volume.

Type: String

Valid Values: `creating | available | in-use | deleting | deleted | error`

Required: No

**throughput**

The throughput that the volume supports, in MiB/s.

Type: Integer

Required: No

**volumeId**

The ID of the volume.

Type: String

Required: No

**volumeType**

The volume type.

Type: String

Valid Values: `standard | io1 | io2 | gp2 | sc1 | st1 | gp3`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# VolumeStatusAction

Describes a volume status operation code.

## Contents

**code**

The code identifying the operation, for example, `enable-volume-io`.

Type: String

Required: No

**description**

A description of the operation.

Type: String

Required: No

**eventId**

The ID of the event associated with this operation.

Type: String

Required: No

**eventType**

The event type associated with this operation.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++

- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeStatusAttachmentStatus

Information about the instances to which the volume is attached.

## Contents

**instanceId**

The ID of the attached instance.

Type: String

Required: No

**ioPerformance**

The maximum IOPS supported by the attached instance.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeStatusDetails

Describes a volume status.

## Contents

**name**

The name of the volume status.

- `io-enabled` - Indicates the volume I/O status. For more information, see Amazon EBS volume status checks.
- `io-performance` - Indicates the volume performance status. For more information, see Amazon EBS volume status checks.
- `initialization-state` - Indicates the status of the volume initialization process. For more information, see Initialize Amazon EBS volumes.

Type: String

Valid Values: `io-enabled | io-performance | initialization-state`

Required: No

**status**

The intended status of the volume status.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeStatusEvent

Describes a volume status event.

## Contents

**description**

A description of the event.

Type: String

Required: No

**eventId**

The ID of this event.

Type: String

Required: No

**eventType**

The type of this event.

Type: String

Required: No

**instanceId**

The ID of the instance associated with the event.

Type: String

Required: No

**notAfter**

The latest end time of the event.

Type: Timestamp

Required: No

**notBefore**

The earliest start time of the event.

Type: Timestamp

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeStatusInfo

Describes the status of a volume.

## Contents

**Details.N**

The details of the volume status.

Type: Array of VolumeStatusDetails objects

Required: No

**status**

The status of the volume.

Type: String

Valid Values: `ok | impaired | insufficient-data | warning`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VolumeStatusItem

Describes the volume status.

## Contents

**ActionsSet.N**

The details of the operation.

Type: Array of VolumeStatusAction objects

Required: No

**AttachmentStatuses.N**

Information about the instances to which the volume is attached.

Type: Array of VolumeStatusAttachmentStatus objects

Required: No

**availabilityZone**

The Availability Zone of the volume.

Type: String

Required: No

**availabilityZoneId**

The ID of the Availability Zone.

Type: String

Required: No

**EventsSet.N**

A list of events associated with the volume.

Type: Array of VolumeStatusEvent objects

Required: No

**initializationStatusDetails**

Information about the volume initialization. It can take up to 5 minutes for the volume initialization information to be updated.

Only available for volumes created from snapshots. Not available for empty volumes created without a snapshot.

For more information, see Initialize Amazon EBS volumes.

Type: InitializationStatusDetails object

Required: No

**operator**

The service provider that manages the resource.

Type: OperatorResponse object

Required: No

**outpostArn**

The Amazon Resource Name (ARN) of the Outpost.

Type: String

Required: No

**volumeId**

The volume ID.

Type: String

Required: No

**volumeStatus**

The volume status.

Type: VolumeStatusInfo object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# Vpc

Describes a VPC.

## Contents

**blockPublicAccessStates**

The state of VPC Block Public Access (BPA).

Type: BlockPublicAccessStates object

Required: No

**cidrBlock**

The primary IPv4 CIDR block for the VPC.

Type: String

Required: No

**CidrBlockAssociationSet.N**

Information about the IPv4 CIDR blocks associated with the VPC.

Type: Array of VpcCidrBlockAssociation objects

Required: No

**dhcpOptionsId**

The ID of the set of DHCP options you've associated with the VPC.

Type: String

Required: No

**instanceTenancy**

The allowed tenancy of instances launched into the VPC.

Type: String

Valid Values: `default | dedicated | host`

Required: No

**Ipv6CidrBlockAssociationSet.N**

Information about the IPv6 CIDR blocks associated with the VPC.

Type: Array of VpcIpv6CidrBlockAssociation objects

Required: No

**isDefault**

Indicates whether the VPC is the default VPC.

Type: Boolean

Required: No

**ownerId**

The ID of the AWS account that owns the VPC.

Type: String

Required: No

**state**

The current state of the VPC.

Type: String

Valid Values: `pending | available`

Required: No

**TagSet.N**

Any tags assigned to the VPC.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcAttachment

Describes an attachment between a virtual private gateway and a VPC.

## Contents

**state**

The current state of the attachment.

Type: String

Valid Values: `attaching | attached | detaching | detached`

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcBlockPublicAccessExclusion

A VPC BPA exclusion is a mode that can be applied to a single VPC or subnet that exempts it from the account's BPA mode and will allow bidirectional or egress-only access. You can create BPA exclusions for VPCs and subnets even when BPA is not enabled on the account to ensure that there is no traffic disruption to the exclusions when VPC BPA is turned on. To learn more about VPC BPA, see Block public access to VPCs and subnets in the *Amazon VPC User Guide*.

## Contents

**creationTimestamp**

When the exclusion was created.

Type: Timestamp

Required: No

**deletionTimestamp**

When the exclusion was deleted.

Type: Timestamp

Required: No

**exclusionId**

The ID of the exclusion.

Type: String

Required: No

**internetGatewayExclusionMode**

The exclusion mode for internet gateway traffic.

- `allow-bidirectional`: Allow all internet traffic to and from the excluded VPCs and subnets.
- `allow-egress`: Allow outbound internet traffic from the excluded VPCs and subnets. Block inbound internet traffic to the excluded VPCs and subnets. Only applies when VPC Block Public Access is set to Bidirectional.

Type: String

Valid Values: `allow-bidirectional | allow-egress`

Required: No

**lastUpdateTimestamp**

When the exclusion was last updated.

Type: Timestamp

Required: No

**reason**

The reason for the current exclusion state.

Type: String

Required: No

**resourceArn**

The ARN of the exclusion.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 1283.

Required: No

**state**

The state of the exclusion.

Type: String

Valid Values: `create-in-progress | create-complete | create-failed | update-in-progress | update-complete | update-failed | delete-in-progress | delete-complete | disable-in-progress | disable-complete`

Required: No

**TagSet.N**

`tag` - The key/value combination of a tag assigned to the resource. Use the tag key in the filter name and the tag value as the filter value. For example, to find all resources that have a tag

with the key `Owner` and the value `TeamA`, specify `tag:Owner` for the filter name and `TeamA` for the filter value.

Type: Array of Tag objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcBlockPublicAccessOptions

VPC Block Public Access (BPA) enables you to block resources in VPCs and subnets that you own in a Region from reaching or being reached from the internet through internet gateways and egress-only internet gateways. To learn more about VPC BPA, see Block public access to VPCs and subnets in the *Amazon VPC User Guide*.

## Contents

**awsAccountId**

An AWS account ID.

Type: String

Required: No

**awsRegion**

An AWS Region.

Type: String

Required: No

**exclusionsAllowed**

Determines if exclusions are allowed. If you have enabled VPC BPA at the Organization level, exclusions may be `not-allowed`. Otherwise, they are `allowed`.

Type: String

Valid Values: `allowed | not-allowed`

Required: No

**internetGatewayBlockMode**

The current mode of VPC BPA.

- `off`: VPC BPA is not enabled and traffic is allowed to and from internet gateways and egress-only internet gateways in this Region.
- `block-bidirectional`: Block all traffic to and from internet gateways and egress-only internet gateways in this Region (except for excluded VPCs and subnets).

- `block-ingress`: Block all internet traffic to the VPCs in this Region (except for VPCs or subnets which are excluded). Only traffic to and from NAT gateways and egress-only internet gateways is allowed because these gateways only allow outbound connections to be established.

Type: String

Valid Values: `off | block-bidirectional | block-ingress`

Required: No

**lastUpdateTimestamp**

The last time the VPC BPA mode was updated.

Type: Timestamp

Required: No

**managedBy**

The entity that manages the state of VPC BPA. Possible values include:

- `account` - The state is managed by the account.
- `declarative-policy` - The state is managed by a declarative policy and can't be modified by the account.

Type: String

Valid Values: `account | declarative-policy`

Required: No

**reason**

The reason for the current state.

Type: String

Required: No

**state**

The current state of VPC BPA.

Type: String

Valid Values: `default-state | update-in-progress | update-complete`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcCidrBlockAssociation

Describes an IPv4 CIDR block associated with a VPC.

## Contents

**associationId**

The association ID for the IPv4 CIDR block.

Type: String

Required: No

**cidrBlock**

The IPv4 CIDR block.

Type: String

Required: No

**cidrBlockState**

Information about the state of the CIDR block.

Type: VpcCidrBlockState object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcCidrBlockState

Describes the state of a CIDR block.

## Contents

**state**

The state of the CIDR block.

Type: String

Valid Values: `associating | associated | disassociating | disassociated | failing | failed`

Required: No

**statusMessage**

A message about the status of the CIDR block, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcClassicLink

> **Note**
>
> Deprecated.

Describes whether a VPC is enabled for ClassicLink.

## Contents

**classicLinkEnabled**

Indicates whether the VPC is enabled for ClassicLink.

Type: Boolean

Required: No

**TagSet.N**

Any tags assigned to the VPC.

Type: Array of Tag objects

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2

- AWS SDK for Ruby V3

# VpcEncryptionControl

Describes the configuration and state of VPC encryption controls.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

## Contents

**mode**

The encryption mode for the VPC Encryption Control configuration.

Type: String

Valid Values: `monitor | enforce`

Required: No

**resourceExclusions**

Information about resource exclusions for the VPC Encryption Control configuration.

Type: VpcEncryptionControlExclusions object

Required: No

**state**

The current state of the VPC Encryption Control configuration.

Type: String

Valid Values: `enforce-in-progress | monitor-in-progress | enforce-failed | monitor-failed | deleting | deleted | available | creating | delete-failed`

Required: No

**stateMessage**

A message providing additional information about the encryption control state.

Type: String

Required: No

**TagSet.N**

The tags assigned to the VPC Encryption Control configuration.

Type: Array of Tag objects

Required: No

**vpcEncryptionControlId**

The ID of the VPC Encryption Control configuration.

Type: String

Required: No

**vpcId**

The ID of the VPC associated with the encryption control configuration.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcEncryptionControlConfiguration

Describes the configuration settings for VPC Encryption Control.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

## Contents

**Mode**

The encryption mode for the VPC Encryption Control configuration.

Type: String

Valid Values: `monitor | enforce`

Required: Yes

**EgressOnlyInternetGatewayExclusion**

Specifies whether to exclude egress-only internet gateway traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**ElasticFileSystemExclusion**

Specifies whether to exclude Elastic File System traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**InternetGatewayExclusion**

Specifies whether to exclude internet gateway traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**LambdaExclusion**

Specifies whether to exclude Lambda function traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**NatGatewayExclusion**

Specifies whether to exclude NAT gateway traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**VirtualPrivateGatewayExclusion**

Specifies whether to exclude virtual private gateway traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**VpcLatticeExclusion**

Specifies whether to exclude VPC Lattice traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

**VpcPeeringExclusion**

Specifies whether to exclude VPC peering connection traffic from encryption enforcement.

Type: String

Valid Values: `enable | disable`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcEncryptionControlExclusion

Describes an exclusion configuration for VPC Encryption Control.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

## Contents

**state**

The current state of the exclusion configuration.

Type: String

Valid Values: `enabling | enabled | disabling | disabled`

Required: No

**stateMessage**

A message providing additional information about the exclusion state.

Type: String

Required: No

## See Also

# VpcEncryptionControlExclusions

Describes the exclusion configurations for various resource types in VPC Encryption Control.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

## Contents

**egressOnlyInternetGateway**

The exclusion configuration for egress-only internet gateway traffic.

Type: VpcEncryptionControlExclusion object

Required: No

**elasticFileSystem**

The exclusion configuration for Elastic File System traffic.

Type: VpcEncryptionControlExclusion object

Required: No

**internetGateway**

The exclusion configuration for internet gateway traffic.

Type: VpcEncryptionControlExclusion object

Required: No

**lambda**

The exclusion configuration for Lambda function traffic.

Type: VpcEncryptionControlExclusion object

Required: No

**natGateway**

The exclusion configuration for NAT gateway traffic.

Type: VpcEncryptionControlExclusion object

Required: No

**virtualPrivateGateway**

The exclusion configuration for virtual private gateway traffic.

Type: VpcEncryptionControlExclusion object

Required: No

**vpcLattice**

The exclusion configuration for VPC Lattice traffic.

Type: VpcEncryptionControlExclusion object

Required: No

**vpcPeering**

The exclusion configuration for VPC peering connection traffic.

Type: VpcEncryptionControlExclusion object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcEncryptionNonCompliantResource

Describes a resource that is not compliant with VPC encryption requirements.

For more information, see Enforce VPC encryption in transit in the *Amazon VPC User Guide*.

## Contents

**description**

A description of the non-compliant resource.

Type: String

Required: No

**id**

The ID of the non-compliant resource.

Type: String

Required: No

**isExcludable**

Indicates whether the resource can be excluded from encryption enforcement.

Type: Boolean

Required: No

**type**

The type of the non-compliant resource.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcEndpoint

Describes a VPC endpoint.

## Contents

**creationTimestamp**

The date and time that the endpoint was created.

Type: Timestamp

Required: No

**DnsEntrySet.N**

(Interface endpoint) The DNS entries for the endpoint.

Type: Array of DnsEntry objects

Required: No

**dnsOptions**

The DNS options for the endpoint.

Type: DnsOptions object

Required: No

**failureReason**

Reason for the failure.

Type: String

Required: No

**GroupSet.N**

(Interface endpoint) Information about the security groups that are associated with the network interface.

Type: Array of SecurityGroupIdentifier objects

Required: No

**ipAddressType**

The IP address type for the endpoint.

Type: String

Valid Values: `ipv4 | dualstack | ipv6`

Required: No

**Ipv4PrefixSet.N**

Array of IPv4 prefixes.

Type: Array of SubnetIpPrefixes objects

Required: No

**Ipv6PrefixSet.N**

Array of IPv6 prefixes.

Type: Array of SubnetIpPrefixes objects

Required: No

**lastError**

The last error that occurred for endpoint.

Type: LastError object

Required: No

**NetworkInterfaceIdSet.N**

(Interface endpoint) The network interfaces for the endpoint.

Type: Array of strings

Required: No

**ownerId**

The ID of the AWS account that owns the endpoint.

Type: String

Required: No

**policyDocument**

The policy document associated with the endpoint, if applicable.

Type: String

Required: No

**privateDnsEnabled**

(Interface endpoint) Indicates whether the VPC is associated with a private hosted zone.

Type: Boolean

Required: No

**requesterManaged**

Indicates whether the endpoint is being managed by its service.

Type: Boolean

Required: No

**resourceConfigurationArn**

The Amazon Resource Name (ARN) of the resource configuration.

Type: String

Required: No

**RouteTableIdSet.N**

(Gateway endpoint) The IDs of the route tables associated with the endpoint.

Type: Array of strings

Required: No

**serviceName**

The name of the service to which the endpoint is associated.

Type: String

Required: No

**serviceNetworkArn**

The Amazon Resource Name (ARN) of the service network.

Type: String

Required: No

**serviceRegion**

The Region where the service is hosted.

Type: String

Required: No

**state**

The state of the endpoint.

Type: String

Valid Values: `PendingAcceptance | Pending | Available | Deleting | Deleted | Rejected | Failed | Expired | Partial`

Required: No

**SubnetIdSet.N**

(Interface endpoint) The subnets for the endpoint.

Type: Array of strings

Required: No

**TagSet.N**

The tags assigned to the endpoint.

Type: Array of Tag objects

Required: No

**vpcEndpointId**

The ID of the endpoint.

Type: String

Required: No

**vpcEndpointType**

The type of endpoint.

Type: String

Valid Values: `Interface | Gateway | GatewayLoadBalancer | Resource | ServiceNetwork`

Required: No

**vpcId**

The ID of the VPC to which the endpoint is associated.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcEndpointAssociation

Describes the VPC resources, VPC endpoint services, Lattice services, or service networks associated with the VPC endpoint.

## Contents

**associatedResourceAccessibility**

The connectivity status of the resources associated to a VPC endpoint. The resource is accessible if the associated resource configuration is `AVAILABLE`, otherwise the resource is inaccessible.

Type: String

Required: No

**associatedResourceArn**

The Amazon Resource Name (ARN) of the associated resource.

Type: String

Required: No

**dnsEntry**

The DNS entry of the VPC endpoint association.

Type: DnsEntry object

Required: No

**failureCode**

An error code related to why an VPC endpoint association failed.

Type: String

Required: No

**failureReason**

A message related to why an VPC endpoint association failed.

Type: String

Required: No

**id**

The ID of the VPC endpoint association.

Type: String

Required: No

**privateDnsEntry**

The private DNS entry of the VPC endpoint association.

Type: DnsEntry object

Required: No

**resourceConfigurationGroupArn**

The Amazon Resource Name (ARN) of the resource configuration group.

Type: String

Required: No

**serviceNetworkArn**

The Amazon Resource Name (ARN) of the service network.

Type: String

Required: No

**serviceNetworkName**

The name of the service network.

Type: String

Required: No

**TagSet.N**

The tags to apply to the VPC endpoint association.

Type: Array of Tag objects

Required: No

**vpcEndpointId**

The ID of the VPC endpoint.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcEndpointConnection

Describes a VPC endpoint connection to a service.

## Contents

**creationTimestamp**

The date and time that the VPC endpoint was created.

Type: Timestamp

Required: No

**DnsEntrySet.N**

The DNS entries for the VPC endpoint.

Type: Array of DnsEntry objects

Required: No

**GatewayLoadBalancerArnSet.N**

The Amazon Resource Names (ARNs) of the Gateway Load Balancers for the service.

Type: Array of strings

Required: No

**ipAddressType**

The IP address type for the endpoint.

Type: String

Valid Values: `ipv4 | dualstack | ipv6`

Required: No

**NetworkLoadBalancerArnSet.N**

The Amazon Resource Names (ARNs) of the network load balancers for the service.

Type: Array of strings

Required: No

**serviceId**

The ID of the service to which the endpoint is connected.

Type: String

Required: No

**TagSet.N**

The tags.

Type: Array of Tag objects

Required: No

**vpcEndpointConnectionId**

The ID of the VPC endpoint connection.

Type: String

Required: No

**vpcEndpointId**

The ID of the VPC endpoint.

Type: String

Required: No

**vpcEndpointOwner**

The ID of the AWS account that owns the VPC endpoint.

Type: String

Required: No

**vpcEndpointRegion**

The Region of the endpoint.

Type: String

Required: No

**vpcEndpointState**

The state of the VPC endpoint.

Type: String

Valid Values: `PendingAcceptance | Pending | Available | Deleting | Deleted | Rejected | Failed | Expired | Partial`

Required: No

## See Also

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcIpv6CidrBlockAssociation

Describes an IPv6 CIDR block associated with a VPC.

## Contents

**associationId**

The association ID for the IPv6 CIDR block.

Type: String

Required: No

**ipSource**

The source that allocated the IP address space. `byoip` or `amazon` indicates public IP address space allocated by Amazon or space that you have allocated with Bring your own IP (BYOIP). `none` indicates private space.

Type: String

Valid Values: `amazon | byoip | none`

Required: No

**ipv6AddressAttribute**

Public IPv6 addresses are those advertised on the internet from AWS. Private IP addresses are not and cannot be advertised on the internet from AWS.

Type: String

Valid Values: `public | private`

Required: No

**ipv6CidrBlock**

The IPv6 CIDR block.

Type: String

Required: No

**ipv6CidrBlockState**

Information about the state of the CIDR block.

Type: VpcCidrBlockState object

Required: No

**ipv6Pool**

The ID of the IPv6 address pool from which the IPv6 CIDR block is allocated.

Type: String

Required: No

**networkBorderGroup**

The name of the unique set of Availability Zones, Local Zones, or Wavelength Zones from which AWS advertises IP addresses, for example, `us-east-1-wl1-bos-wlz-1`.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcPeeringConnection

Describes a VPC peering connection.

## Contents

**accepterVpcInfo**

Information about the accepter VPC. CIDR block information is only returned when describing an active VPC peering connection.

Type: VpcPeeringConnectionVpcInfo object

Required: No

**expirationTime**

The time that an unaccepted VPC peering connection will expire.

Type: Timestamp

Required: No

**requesterVpcInfo**

Information about the requester VPC. CIDR block information is only returned when describing an active VPC peering connection.

Type: VpcPeeringConnectionVpcInfo object

Required: No

**status**

The status of the VPC peering connection.

Type: VpcPeeringConnectionStateReason object

Required: No

**TagSet.N**

Any tags assigned to the resource.

Type: Array of Tag objects

Required: No

**vpcPeeringConnectionId**

The ID of the VPC peering connection.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcPeeringConnectionOptionsDescription

Describes the VPC peering connection options.

## Contents

**allowDnsResolutionFromRemoteVpc**

Indicates whether a local VPC can resolve public DNS hostnames to private IP addresses when queried from instances in a peer VPC.

Type: Boolean

Required: No

**allowEgressFromLocalClassicLinkToRemoteVpc**

Deprecated.

Type: Boolean

Required: No

**allowEgressFromLocalVpcToRemoteClassicLink**

Deprecated.

Type: Boolean

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcPeeringConnectionStateReason

Describes the status of a VPC peering connection.

## Contents

**code**

The status of the VPC peering connection.

Type: String

Valid Values: `initiating-request | pending-acceptance | active | deleted | rejected | failed | expired | provisioning | deleting`

Required: No

**message**

A message that provides more information about the status, if applicable.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpcPeeringConnectionVpcInfo

Describes a VPC in a VPC peering connection.

## Contents

**cidrBlock**

The IPv4 CIDR block for the VPC.

Type: String

Required: No

**CidrBlockSet.N**

Information about the IPv4 CIDR blocks for the VPC.

Type: Array of CidrBlock objects

Required: No

**Ipv6CidrBlockSet.N**

The IPv6 CIDR block for the VPC.

Type: Array of Ipv6CidrBlock objects

Required: No

**ownerId**

The ID of the AWS account that owns the VPC.

Type: String

Required: No

**peeringOptions**

Information about the VPC peering connection options for the accepter or requester VPC.

Type: VpcPeeringConnectionOptionsDescription object

Required: No

**region**

The Region in which the VPC is located.

Type: String

Required: No

**vpcId**

The ID of the VPC.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnConcentrator

Describes a VPN concentrator.

## Contents

**state**

The current state of the VPN concentrator.

Type: String

Required: No

**TagSet.N**

Any tags assigned to the VPN concentrator.

Type: Array of Tag objects

Required: No

**transitGatewayAttachmentId**

The ID of the transit gateway attachment for the VPN concentrator.

Type: String

Required: No

**transitGatewayId**

The ID of the transit gateway associated with the VPN concentrator.

Type: String

Required: No

**type**

The type of VPN concentrator.

Type: String

Required: No

**vpnConcentratorId**

The ID of the VPN concentrator.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnConnection

Describes a VPN connection.

## Contents

**category**

The category of the VPN connection. A value of `VPN` indicates an AWS VPN connection. A value of `VPN-Classic` indicates an AWS Classic VPN connection.

Type: String

Required: No

**coreNetworkArn**

The ARN of the core network.

Type: String

Required: No

**coreNetworkAttachmentArn**

The ARN of the core network attachment.

Type: String

Required: No

**customerGatewayConfiguration**

The configuration information for the VPN connection's customer gateway (in the native XML format). This element is always present in the CreateVpnConnection response; however, it's present in the DescribeVpnConnections response only if the VPN connection is in the `pending` or `available` state.

Type: String

Required: No

**customerGatewayId**

The ID of the customer gateway at your end of the VPN connection.

Type: String

Required: No

**gatewayAssociationState**

The current state of the gateway association.

Type: String

Valid Values: `associated | not-associated | associating | disassociating`

Required: No

**options**

The VPN connection options.

Type: VpnConnectionOptions object

Required: No

**preSharedKeyArn**

The Amazon Resource Name (ARN) of the Secrets Manager secret storing the pre-shared key(s) for the VPN connection.

Type: String

Required: No

**Routes.N**

The static routes associated with the VPN connection.

Type: Array of VpnStaticRoute objects

Required: No

**state**

The current state of the VPN connection.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**TagSet.N**

Any tags assigned to the VPN connection.

Type: Array of Tag objects

Required: No

**transitGatewayId**

The ID of the transit gateway associated with the VPN connection.

Type: String

Required: No

**type**

The type of VPN connection.

Type: String

Valid Values: `ipsec.1`

Required: No

**VgwTelemetry.N**

Information about the VPN tunnel.

Type: Array of VgwTelemetry objects

Required: No

**vpnConcentratorId**

The ID of the VPN concentrator associated with the VPN connection.

Type: String

Required: No

**vpnConnectionId**

The ID of the VPN connection.

Type: String

Required: No

**vpnGatewayId**

The ID of the virtual private gateway at the AWS side of the VPN connection.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnConnectionDeviceType

List of customer gateway devices that have a sample configuration file available for use. You can also see the list of device types with sample configuration files available under Your customer gateway device in the *AWS Site-to-Site VPN User Guide*.

## Contents

**platform**

Customer gateway device platform.

Type: String

Required: No

**software**

Customer gateway device software version.

Type: String

Required: No

**vendor**

Customer gateway device vendor.

Type: String

Required: No

**vpnConnectionDeviceTypeId**

Customer gateway device identifier.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnConnectionOptions

Describes VPN connection options.

## Contents

**enableAcceleration**

Indicates whether acceleration is enabled for the VPN connection.

Type: Boolean

Required: No

**localIpv4NetworkCidr**

The IPv4 CIDR on the customer gateway (on-premises) side of the VPN connection.

Type: String

Required: No

**localIpv6NetworkCidr**

The IPv6 CIDR on the customer gateway (on-premises) side of the VPN connection.

Type: String

Required: No

**outsideIpAddressType**

The type of IPv4 address assigned to the outside interface of the customer gateway.

Valid values: `PrivateIpv4` | `PublicIpv4` | `Ipv6`

Default: `PublicIpv4`

Type: String

Required: No

**remoteIpv4NetworkCidr**

The IPv4 CIDR on the AWS side of the VPN connection.

Type: String

Required: No

**remoteIpv6NetworkCidr**

The IPv6 CIDR on the AWS side of the VPN connection.

Type: String

Required: No

**staticRoutesOnly**

Indicates whether the VPN connection uses static routes only. Static routes must be used for devices that don't support BGP.

Type: Boolean

Required: No

**transportTransitGatewayAttachmentId**

The transit gateway attachment ID in use for the VPN tunnel.

Type: String

Required: No

**tunnelBandwidth**

The configured bandwidth for the VPN tunnel. Represents the current throughput capacity setting for the tunnel connection. `standard` tunnel bandwidth supports up to 1.25 Gbps per tunnel while `large` supports up to 5 Gbps per tunnel. If no tunnel bandwidth was specified for the connection, `standard` is used as the default value.

Type: String

Valid Values: `standard | large`

Required: No

**tunnelInsideIpVersion**

Indicates whether the VPN tunnels process IPv4 or IPv6 traffic.

Type: String

Valid Values: `ipv4 | ipv6`

Required: No

**TunnelOptionSet.N**

Indicates the VPN tunnel options.

Type: Array of TunnelOption objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnConnectionOptionsSpecification

Describes VPN connection options.

## Contents

**EnableAcceleration**

Indicate whether to enable acceleration for the VPN connection.

Default: `false`

Type: Boolean

Required: No

**LocalIpv4NetworkCidr**

The IPv4 CIDR on the customer gateway (on-premises) side of the VPN connection.

Default: `0.0.0.0/0`

Type: String

Required: No

**LocalIpv6NetworkCidr**

The IPv6 CIDR on the customer gateway (on-premises) side of the VPN connection.

Default: `::/0`

Type: String

Required: No

**OutsideIpAddressType**

The type of IP address assigned to the outside interface of the customer gateway device.

Valid values: `PrivateIpv4` | `PublicIpv4` | `Ipv6`

Default: `PublicIpv4`

Type: String

Required: No

**RemoteIpv4NetworkCidr**

The IPv4 CIDR on the AWS side of the VPN connection.

Default: `0.0.0.0/0`

Type: String

Required: No

**RemoteIpv6NetworkCidr**

The IPv6 CIDR on the AWS side of the VPN connection.

Default: `::/0`

Type: String

Required: No

**StaticRoutesOnly**

Indicate whether the VPN connection uses static routes only. If you are creating a VPN connection for a device that does not support BGP, you must specify `true`. Use CreateVpnConnectionRoute to create a static route.

Default: `false`

Type: Boolean

Required: No

**TransportTransitGatewayAttachmentId**

The transit gateway attachment ID to use for the VPN tunnel.

Required if `OutsideIpAddressType` is set to `PrivateIpv4`.

Type: String

Required: No

**TunnelBandwidth**

The desired bandwidth specification for the VPN tunnel, used when creating or modifying VPN connection options to set the tunnel's throughput capacity. `standard` supports up to 1.25 Gbps per tunnel, while `large` supports up to 5 Gbps per tunnel. The default value is `standard`. Existing VPN connections without a bandwidth setting will automatically default to `standard`.

Type: String

Valid Values: `standard | large`

Required: No

**TunnelInsideIpVersion**

Indicate whether the VPN tunnels process IPv4 or IPv6 traffic.

Default: `ipv4`

Type: String

Valid Values: `ipv4 | ipv6`

Required: No

**TunnelOptions.N**

The tunnel options for the VPN connection.

Type: Array of VpnTunnelOptionsSpecification objects

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnGateway

Describes a virtual private gateway.

## Contents

**amazonSideAsn**

The private Autonomous System Number (ASN) for the Amazon side of a BGP session.

Type: Long

Required: No

**Attachments.N**

Any VPCs attached to the virtual private gateway.

Type: Array of VpcAttachment objects

Required: No

**availabilityZone**

The Availability Zone where the virtual private gateway was created, if applicable. This field may be empty or not returned.

Type: String

Required: No

**state**

The current state of the virtual private gateway.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

**TagSet.N**

Any tags assigned to the virtual private gateway.

Type: Array of Tag objects

Required: No

**type**

The type of VPN connection the virtual private gateway supports.

Type: String

Valid Values: `ipsec.1`

Required: No

**vpnGatewayId**

The ID of the virtual private gateway.

Type: String

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnStaticRoute

Describes a static route for a VPN connection.

## Contents

**destinationCidrBlock**

The CIDR block associated with the local subnet of the customer data center.

Type: String

Required: No

**source**

Indicates how the routes were provided.

Type: String

Valid Values: `Static`

Required: No

**state**

The current state of the static route.

Type: String

Valid Values: `pending | available | deleting | deleted`

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnTunnelLogOptions

Options for logging VPN tunnel activity.

## Contents

**cloudWatchLogOptions**

Options for sending VPN tunnel logs to CloudWatch.

Type: CloudWatchLogOptions object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnTunnelLogOptionsSpecification

Options for logging VPN tunnel activity.

## Contents

**CloudWatchLogOptions**

Options for sending VPN tunnel logs to CloudWatch.

Type: CloudWatchLogOptionsSpecification object

Required: No

## See Also

For more information about using this API in one of the language-specific AWS SDKs, see the following:

- AWS SDK for C++
- AWS SDK for Java V2
- AWS SDK for Ruby V3

# VpnTunnelOptionsSpecification

The tunnel options for a single VPN tunnel.

## Contents

**DPDTimeoutAction**

The action to take after DPD timeout occurs. Specify `restart` to restart the IKE initiation. Specify `clear` to end the IKE session.

Valid Values: `clear` | none | `restart`

Default: `clear`

Type: String

Required: No

**DPDTimeoutSeconds**

The number of seconds after which a DPD timeout occurs.

Constraints: A value greater than or equal to 30.

Default: `30`

Type: Integer

Required: No

**EnableTunnelLifecycleControl**

Turn on or off tunnel endpoint lifecycle control feature.

Type: Boolean

Required: No

**IKEVersion.N**

The IKE versions that are permitted for the VPN tunnel.

Valid values: `ikev1` | `ikev2`

Type: Array of IKEVersionsRequestListValue objects

Required: No

**LogOptions**

Options for logging VPN tunnel activity.

Type: VpnTunnelLogOptionsSpecification object

Required: No

**Phase1DHGroupNumber.N**

One or more Diffie-Hellman group numbers that are permitted for the VPN tunnel for phase 1 IKE negotiations.

Valid values: 2 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24

Type: Array of Phase1DHGroupNumbersRequestListValue objects

Required: No

**Phase1EncryptionAlgorithm.N**

One or more encryption algorithms that are permitted for the VPN tunnel for phase 1 IKE negotiations.

Valid values: AES128 | AES256 | AES128-GCM-16 | AES256-GCM-16

Type: Array of Phase1EncryptionAlgorithmsRequestListValue objects

Required: No

**Phase1IntegrityAlgorithm.N**

One or more integrity algorithms that are permitted for the VPN tunnel for phase 1 IKE negotiations.

Valid values: SHA1 | SHA2-256 | SHA2-384 | SHA2-512

Type: Array of Phase1IntegrityAlgorithmsRequestListValue objects

Required: No

**Phase1LifetimeSeconds**

The lifetime for phase 1 of the IKE negotiation, in seconds.

Constraints: A value between 900 and 28,800.

Default: `28800`

Type: Integer

Required: No

**Phase2DHGroupNumber.N**

One or more Diffie-Hellman group numbers that are permitted for the VPN tunnel for phase 2 IKE negotiations.

Valid values: 2 | 5 | 14 | 15 | 16 | 17 | 18 | 19 | 20 | 21 | 22 | 23 | 24

Type: Array of Phase2DHGroupNumbersRequestListValue objects

Required: No

**Phase2EncryptionAlgorithm.N**

One or more encryption algorithms that are permitted for the VPN tunnel for phase 2 IKE negotiations.

Valid values: `AES128` | `AES256` | `AES128-GCM-16` | `AES256-GCM-16`

Type: Array of Phase2EncryptionAlgorithmsRequestListValue objects

Required: No

**Phase2IntegrityAlgorithm.N**

One or more integrity algorithms that are permitted for the VPN tunnel for phase 2 IKE negotiations.

Valid values: `SHA1` | `SHA2-256` | `SHA2-384` | `SHA2-512`

Type: Array of Phase2IntegrityAlgorithmsRequestListValue objects

Required: No

**Phase2LifetimeSeconds**

The lifetime for phase 2 of the IKE negotiation, in seconds.

Constraints: A value between 900 and 3,600. The value must be less than the value for `Phase1LifetimeSeconds`.

Default: `3600`

Type: Integer

Required: No

**PreSharedKey**

The pre-shared key (PSK) to establish initial authentication between the virtual private gateway and customer gateway.

Constraints: Allowed characters are alphanumeric characters, periods (.), and underscores (_). Must be between 8 and 64 characters in length and cannot start with zero (0).

Type: String

Required: No

**RekeyFuzzPercentage**

The percentage of the rekey window (determined by `RekeyMarginTimeSeconds`) during which the rekey time is randomly selected.

Constraints: A value between 0 and 100.

Default: `100`

Type: Integer

Required: No

**RekeyMarginTimeSeconds**

The margin time, in seconds, before the phase 2 lifetime expires, during which the AWS side of the VPN connection performs an IKE rekey. The exact time of the rekey is randomly selected based on the value for `RekeyFuzzPercentage`.

Constraints: A value between 60 and half of `Phase2LifetimeSeconds`.

Default: 270

Type: Integer

Required: No

**ReplayWindowSize**

The number of packets in an IKE replay window.

Constraints: A value between 64 and 2048.

Default: 1024

Type: Integer

Required: No

**StartupAction**

The action to take when the establishing the tunnel for the VPN connection. By default, your customer gateway device must initiate the IKE negotiation and bring up the tunnel. Specify start for AWS to initiate the IKE negotiation.

Valid Values: add | start

Default: add

Type: String

Required: No

**TunnelInsideCidr**

The range of inside IPv4 addresses for the tunnel. Any specified CIDR blocks must be unique across all VPN connections that use the same virtual private gateway.

Constraints: A size /30 CIDR block from the 169.254.0.0/16 range. The following CIDR blocks are reserved and cannot be used:

- 169.254.0.0/30
- 169.254.1.0/30
- 169.254.2.0/30
- 169.254.3.0/30

- `169.254.4.0/30`
- `169.254.5.0/30`
- `169.254.169.252/30`

Type: String

Required: No

**TunnelInsideIpv6Cidr**

The range of inside IPv6 addresses for the tunnel. Any specified CIDR blocks must be unique across all VPN connections that use the same transit gateway.

Constraints: A size /126 CIDR block from the local `fd00::/8` range.

Type: String

Required: No

# Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see Signing AWS API requests in the *IAM User Guide*.

**Action**

The action to be performed.

Type: string

Required: Yes

**Version**

The API version that the request is written for, expressed in the format YYYY-MM-DD.

Type: string

Required: Yes

**X-Amz-Algorithm**

The hash algorithm that you used to create the request signature.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Valid Values: `AWS4-HMAC-SHA256`

Required: Conditional

**X-Amz-Credential**

The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string ("aws4_request"). The value is expressed in the following format: *access_key*/*YYYYMMDD*/*region*/*service*/aws4_request.

For more information, see Create a signed AWS API request in the *IAM User Guide*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

**X-Amz-Date**

The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: `20120325T120000Z`.

Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see Elements of an AWS API request signature in the *IAM User Guide*.

Type: string

Required: Conditional

**X-Amz-Security-Token**

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS STS, see AWS services that work with IAM in the *IAM User Guide*.

Condition: If you're using temporary security credentials from AWS STS, you must include the security token.

Type: string

Required: Conditional

**X-Amz-Signature**

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

**X-Amz-SignedHeaders**

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see Create a signed AWS API request in the *IAM User Guide*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

# Common Error Types

This section lists common error types that this AWS service may return. Not all services return all error types listed here. For errors specific to an API action for this service, see the topic for that API action.

**AccessDeniedException**

You don't have permission to perform this action. Verify that your IAM policy includes the required permissions.

HTTP Status Code: 403

**ExpiredTokenException**

The security token included in the request has expired. Request a new security token and try again.

HTTP Status Code: 403

**IncompleteSignature**

The request signature doesn't conform to AWS standards. Verify that you're using valid AWS credentials and that your request is properly formatted. If you're using an SDK, ensure it's up to date.

HTTP Status Code: 400

**InternalFailure**

The request can't be processed right now because of an internal server issue. Try again later. If the problem persists, contact AWS Support.

HTTP Status Code: 500

**InvalidParameterCombination**

Parameters that must not be used together were used together. Remove one of the conflicting parameters and try again.

HTTP Status Code: 400

**InvalidParameterValue**

A value that you provided for a parameter isn't valid. Check the parameter constraints and try again.

HTTP Status Code: 400

**InvalidQueryParameter**

The AWS query string is malformed or doesn't adhere to AWS standards. Verify the query string format and try again.

HTTP Status Code: 400

**MalformedQueryString**

The query string contains a syntax error. Verify the query string and try again.

HTTP Status Code: 404

**MissingAction**

The request is missing the Action parameter. Add the Action parameter and try again.

HTTP Status Code: 400

**MissingAuthenticationToken**

The request must contain a valid AWS access key ID or X.509 certificate. Verify that your credentials are included in the request.

HTTP Status Code: 403

**MissingParameter**

A required parameter for the specified action isn't included in the request. Add the missing parameter and try again.

HTTP Status Code: 400

**NotAuthorized**

You don't have permissions to perform this action. Verify that your IAM policy includes the required permissions.

HTTP Status Code: 401

**OptInRequired**

Your AWS account needs a subscription for this service. Verify that you've enabled the service in your account.

HTTP Status Code: 403

**RequestExpired**

The request has expired. This can happen if the request took more than 15 minutes to reach the service, the date stamp is more than 15 minutes in the future, or a pre-signed URL has expired. Generate a new request with a current timestamp and try again.

HTTP Status Code: 400

**ServiceUnavailable**

The service is temporarily unavailable. Try again later.

HTTP Status Code: 503

**ThrottlingException**

Your request rate is too high. The AWS SDKs automatically retry requests that receive this exception. Reduce the frequency of requests.

HTTP Status Code: 400

**UnrecognizedClientException**

The X.509 certificate or AWS access key ID you provided doesn't exist in our records. Verify that you're using valid credentials and that they haven't expired.

HTTP Status Code: 403

**ValidationError**

The input doesn't meet the required format or constraints. Check that all required parameters are included and that values are valid.

HTTP Status Code: 400
