# Welcome

This is the *Amazon EC2 Instance Connect API Reference*. It provides descriptions, syntax, and usage examples for each of the actions for Amazon EC2 Instance Connect. Amazon EC2 Instance Connect enables system administrators to publish one-time use SSH public keys to EC2, providing users a simple and secure way to connect to their instances.

To view the Amazon EC2 Instance Connect content in the *Amazon EC2 User Guide*, see [Connect to your Linux instance using EC2 Instance Connect](#).

For Amazon EC2 APIs, see the [Amazon EC2 API Reference](#).

This document was last published on April 10, 2026.

# Actions

The following actions are supported:

- [SendSerialConsoleSSHPublicKey](#)
- [SendSSHPublicKey](#)

# SendSerialConsoleSSHPublicKey

Pushes an SSH public key to the specified EC2 instance. The key remains for 60 seconds, which gives you 60 seconds to establish a serial console connection to the instance using SSH. For more information, see [EC2 Serial Console](#) in the *Amazon EC2 User Guide*.

## Request Syntax

```
{
  "InstanceId": "string",
  "SerialPort": number,
  "SSHPublicKey": "string"
}
```

## Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

### InstanceId

The ID of the EC2 instance.

Type: String

Length Constraints: Minimum length of 10. Maximum length of 32.

Pattern: `^i-[a-f0-9]+$`

Required: Yes

### SerialPort

The serial port of the EC2 instance. Currently only port 0 is supported.

Default: 0

Type: Integer

Valid Range: Fixed value of 0.

Required: No

## SSHPublicKey

The public key material. To use the public key, you must have the matching private key. For information about the supported key formats and lengths, see [Requirements for key pairs](#) in the *Amazon EC2 User Guide*.

Type: String

Length Constraints: Minimum length of 80. Maximum length of 4096.

Required: Yes

## Response Syntax

```
{
  "RequestId": "string",
  "Success": boolean
}
```

## Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

### RequestId

The ID of the request. Please provide this ID when contacting AWS Support for assistance.

Type: String

### Success

Is true if the request succeeds and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see [Common Error Types](#).

## **AuthException**

Either your AWS credentials are not valid or you do not have access to the EC2 instance.

HTTP Status Code: 400

## **EC2InstanceNotFoundException**

The specified instance was not found.

HTTP Status Code: 400

## **EC2InstanceStateInvalidException**

Unable to connect because the instance is not in a valid state. Connecting to a stopped or terminated instance is not supported. If the instance is stopped, start your instance, and try to connect again.

HTTP Status Code: 400

## **EC2InstanceTypeInvalidException**

The instance type is not supported for connecting via the serial console. Only Nitro instance types are currently supported.

HTTP Status Code: 400

## **EC2InstanceUnavailableException**

The instance is currently unavailable. Wait a few minutes and try again.

HTTP Status Code: 400

## **InvalidArgsException**

One of the parameters is not valid.

HTTP Status Code: 400

## **SerialConsoleAccessDisabledException**

Your account is not authorized to use the EC2 Serial Console. To authorize your account, run the `EnableSerialConsoleAccess` API. For more information, see [EnableSerialConsoleAccess](#) in the *Amazon EC2 API Reference*.

HTTP Status Code: 400

## **SerialConsoleSessionLimitExceededException**

The instance currently has 1 active serial console session. Only 1 session is supported at a time.

HTTP Status Code: 400

## **SerialConsoleSessionUnavailableException**

Unable to start a serial console session. Please try again.

HTTP Status Code: 500

## **ServiceException**

The service encountered an error. Follow the instructions in the error message and try again.

HTTP Status Code: 500

## **ThrottlingException**

The requests were made too frequently and have been throttled. Wait a while and try again. To increase the limit on your request frequency, contact AWS Support.

HTTP Status Code: 400

## **See Also**

- [AWS SDK for Ruby V3](#)

# SendSSHPublicKey

Pushes an SSH public key to the specified EC2 instance for use by the specified user. The key remains for 60 seconds. For more information, see [Connect to your Linux instance using EC2 Instance Connect](#) in the *Amazon EC2 User Guide*.

## Request Syntax

```
{
  "AvailabilityZone": "string",
  "InstanceId": "string",
  "InstanceOSUser": "string",
  "SSHPublicKey": "string"
}
```

## Request Parameters

For information about the parameters that are common to all actions, see [Common Parameters](#).

The request accepts the following data in JSON format.

### [AvailabilityZone](#)

The Availability Zone in which the EC2 instance was launched.

Type: String

Length Constraints: Minimum length of 6. Maximum length of 32.

Pattern:  $^(\w+ -){2,3}\d+\w+ \$$

Required: No

### [InstanceId](#)

The ID of the EC2 instance.

Type: String

Length Constraints: Minimum length of 10. Maximum length of 32.

Pattern:  $^i-[a-f0-9]+ \$$

Required: Yes

### InstanceOSUser

The OS user on the EC2 instance for whom the key can be used to authenticate.

Type: String

Length Constraints: Minimum length of 1. Maximum length of 32.

Pattern: `^[A-Za-z_][A-Za-z0-9\@\. _-]{0,30}[A-Za-z0-9\$_-]?$`

Required: Yes

### SSHPublicKey

The public key material. To use the public key, you must have the matching private key.

Type: String

Length Constraints: Minimum length of 80. Maximum length of 4096.

Required: Yes

## Response Syntax

```
{
  "RequestId": "string",
  "Success": boolean
}
```

## Response Elements

If the action is successful, the service sends back an HTTP 200 response.

The following data is returned in JSON format by the service.

### RequestId

The ID of the request. Please provide this ID when contacting AWS Support for assistance.

Type: String

## Success

Is true if the request succeeds and an error otherwise.

Type: Boolean

## Errors

For information about the errors that are common to all actions, see [Common Error Types](#).

### **AuthException**

Either your AWS credentials are not valid or you do not have access to the EC2 instance.

HTTP Status Code: 400

### **EC2InstanceNotFoundException**

The specified instance was not found.

HTTP Status Code: 400

### **EC2InstanceStateInvalidException**

Unable to connect because the instance is not in a valid state. Connecting to a stopped or terminated instance is not supported. If the instance is stopped, start your instance, and try to connect again.

HTTP Status Code: 400

### **EC2InstanceUnavailableException**

The instance is currently unavailable. Wait a few minutes and try again.

HTTP Status Code: 400

### **InvalidArgsException**

One of the parameters is not valid.

HTTP Status Code: 400

### **ServiceException**

The service encountered an error. Follow the instructions in the error message and try again.

HTTP Status Code: 500

### ThrottlingException

The requests were made too frequently and have been throttled. Wait a while and try again. To increase the limit on your request frequency, contact AWS Support.

HTTP Status Code: 400

## Examples

### Push an SSH public key to an instance

This example sends the specified SSH public key to the specified instance in the specified Availability Zone. The key is used to authenticate the specified user.

#### Sample Request

```
POST / HTTP/1.1
Content-Type: application/x-amz-json-1.1
X-Amz-Target: AWSEC2InstanceConnectService.SendSSHPublicKey

{
  "AvailabilityZone": "us-east-2b",
  "InstanceId": "i-1234567890abcdef0",
  "InstanceOSUser": "ec2-user",
  "SSHPublicKey": "<ssh-public-key-material>"
}
```

# Data Types

The AWS EC2 Instance Connect API has no separate data types.

# Common Parameters

The following list contains the parameters that all actions use for signing Signature Version 4 requests with a query string. Any action-specific parameters are listed in the topic for that action. For more information about Signature Version 4, see [Signing AWS API requests](#) in the *IAM User Guide*.

## X-Amz-Algorithm

The hash algorithm that you used to create the request signature.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Valid Values: AWS4-HMAC-SHA256

Required: Conditional

## X-Amz-Credential

The credential scope value, which is a string that includes your access key, the date, the region you are targeting, the service you are requesting, and a termination string ("aws4\_request"). The value is expressed in the following format: *access\_key/YYYYMMDD/region/service/aws4\_request*.

For more information, see [Create a signed AWS API request](#) in the *IAM User Guide*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

## X-Amz-Date

The date that is used to create the signature. The format must be ISO 8601 basic format (YYYYMMDD'T'HHMMSS'Z'). For example, the following date time is a valid X-Amz-Date value: 20120325T120000Z.

Condition: X-Amz-Date is optional for all requests; it can be used to override the date used for signing requests. If the Date header is specified in the ISO 8601 basic format, X-Amz-Date is not required. When X-Amz-Date is used, it always overrides the value of the Date header. For more information, see [Elements of an AWS API request signature](#) in the *IAM User Guide*.

Type: string

Required: Conditional

### **X-Amz-Security-Token**

The temporary security token that was obtained through a call to AWS Security Token Service (AWS STS). For a list of services that support temporary security credentials from AWS STS, see [AWS services that work with IAM](#) in the *IAM User Guide*.

Condition: If you're using temporary security credentials from AWS STS, you must include the security token.

Type: string

Required: Conditional

### **X-Amz-Signature**

Specifies the hex-encoded signature that was calculated from the string to sign and the derived signing key.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

Required: Conditional

### **X-Amz-SignedHeaders**

Specifies all the HTTP headers that were included as part of the canonical request. For more information about specifying signed headers, see [Create a signed AWS API request](#) in the *IAM User Guide*.

Condition: Specify this parameter when you include authentication information in a query string instead of in the HTTP authorization header.

Type: string

## Required: Conditional

# Common Error Types

This section lists common error types that this AWS service may return. Not all services return all error types listed here. For errors specific to an API action for this service, see the topic for that API action.

## **AccessDeniedException**

You don't have permission to perform this action. Verify that your IAM policy includes the required permissions.

HTTP Status Code: 403

## **ExpiredTokenException**

The security token included in the request has expired. Request a new security token and try again.

HTTP Status Code: 403

## **IncompleteSignature**

The request signature doesn't conform to AWS standards. Verify that you're using valid AWS credentials and that your request is properly formatted. If you're using an SDK, ensure it's up to date.

HTTP Status Code: 403

## **InternalFailure**

The request can't be processed right now because of an internal server issue. Try again later. If the problem persists, contact AWS Support.

HTTP Status Code: 500

## **MalformedHttpRequestException**

The request body can't be processed. This typically happens when the request body can't be decompressed using the specified content encoding algorithm. Verify that the content encoding header matches the compression format used.

HTTP Status Code: 400

**NotAuthorized**

You don't have permissions to perform this action. Verify that your IAM policy includes the required permissions.

HTTP Status Code: 401

**OptInRequired**

Your AWS account needs a subscription for this service. Verify that you've enabled the service in your account.

HTTP Status Code: 403

**RequestAbortedException**

The request was aborted before a response could be returned. This typically happens when the client closes the connection.

HTTP Status Code: 400

**RequestEntityTooLargeException**

The request entity is too large. Reduce the size of the request body and try again.

HTTP Status Code: 413

**RequestTimeoutException**

The request timed out. The server didn't receive the complete request within the expected time frame. Try again.

HTTP Status Code: 408

**ServiceUnavailable**

The service is temporarily unavailable. Try again later.

HTTP Status Code: 503

**ThrottlingException**

Your request rate is too high. The AWS SDKs automatically retry requests that receive this exception. Reduce the frequency of requests.

HTTP Status Code: 400

## **UnknownOperationException**

The action or operation isn't recognized. Verify that the action name is spelled correctly and that it's supported by the API version you're using.

HTTP Status Code: 404

## **UnrecognizedClientException**

The X.509 certificate or AWS access key ID you provided doesn't exist in our records. Verify that you're using valid credentials and that they haven't expired.

HTTP Status Code: 403

## **ValidationError**

The input doesn't meet the required format or constraints. Check that all required parameters are included and that values are valid.

HTTP Status Code: 400
